

Important information after your Implant has been removed

When will my fertility return after removal?

- Fertility can return very rapidly after your implant has been removed.
- You will need to use alternative contraception straight away to avoid pregnancy.
- Please discuss your options for contraception with your Dr/nurse.

After-care advice

- You will have a bandage over the site where the implant has been removed.
- Please keep this clean and dry and keep it in place for 48hrs.
- This will help prevent infection and minimise bruising and swelling.
- When you remove the bandage there will be small plaster strips (steristrips) underneath.
- Please leave these in place for 5-7days.
- Bruising is common but if the arm is very red, swollen, itchy or painful please seek medical advice.
