

Velodrome events and the ability to design your outfit, main improvements of the Bkool Cycling Simulator

The new version of the Bkool cycling simulator offers a number of new features that cement its standing as the most complete on the market.

Madrid, Spain (15 September 2015). Bkool has just released the latest version of its simulator, confirming the company's determination to continue providing the most realistic user experience. With this launch, the Bkool brand seeks to add a touch of fun to the concept of indoor riding, and it's doing so by adding two main features: new and exclusive velodrome events, and a virtual locker room where users can customize the virtual outfits they'll be wearing.

The only cycling simulator with velodrome events

The Bkool cycling simulator is now the only one with velodrome events, offering its users the opportunity to get the most out of the virtual velodrome with both individual and team events.

This exclusive feature consists of a total of three completely new events, based on actual games, that have been adapted to the virtual velodrome.

Individual pursuit, team pursuit and miss and out are the three velodrome competitions that Bkool is using to kick off this season. Each one has different rules and methods, though they all share the same emotions, speed and adrenaline.

Each event was designed to immerse users into an actual competitive environment where they can take part in a unique virtual experience.

Customizable quality and design of outfits

Another new feature offered in the simulator is the ability to use Bkool points to customize the design and quality of the riding outfits

Bkool did this by making available to users a full virtual dressing room where they will be able to choose from a wide range of designs to change the look of their virtual riders.

The simulator also lets users select the quality of the outfits, which will affect their performance. As in real life, higher quality outfits will be lighter and feel better, which will be reflected in the times and stats of the competitions. With use, the outfits will become worn until they have to be replaced using points that are awarded by completing sessions. The variety and originality of the available outfits combines perfectly with a simple and intuitive editor that lets users create personalized designs by adding pictures and logos.

Groups set up within the Bkool simulator will be able to design their own jersey to stand out from the other groups, just like professional cycling teams.

But that's not all...

On top of these new features, the 3D route design has been improved to offer new wind and water effects, new trees, animals, landscapes and even more realistic sceneries.

Rounding it all off is a new warm-up panel that livens up any waiting time with useful tips on getting the most out of the simulator.

About Bkool ®

Bkool is a technology company that creates interactive and innovative solutions for sports and video-gaming. In the field of cycling, it has developed the most advanced trainer and simulator. The simulator lets cyclists ride any route in the world in 3D alongside other cyclists in different places connected in real time. With the simulator, users experience the same sensations they would have on the road. Its 3D World technology simulates any route in the world in 3D and recreates the actual elevation of the terrain and the details in the landscape. Its 3D Real Weather™ technology recreates the weather in real time on any route. Bkool is available in seven languages, including Chinese and Japanese, and distributes its products worldwide.

WHAT MAKES BKOOL DIFFERENT

Bkool is the most advanced cycling simulator. These are just some of the features that set Bkool apart from other cycling simulators and that make it a pioneer in developing applied cycling simulations:

Bkool 3D World. The simulator reproduces the landscape anywhere in the world in 3D, recreating rivers, trees and rocks in the area. It also reproduces elements of any type added to the environment by man, such as toads and buildings. This is possible because the simulator knows the landscape anywhere on the planet. This feature was launched in August 2014.

Unlimited 3D scenery. Bkool's great contribution to cycling, thanks to its 3D World technology, is the ability to have unlimited virtual 3D settings, unlike other simulators, which have a limited number of pre-recorded routes.

Bkool 3D Real Weather™. The simulator recreates the weather on any route, with elements such as rain, sunshine, wind and snow. It does so in real time and covers every route in the world. It also accounts for the hour of the day and displays the correct position of the sun and moon in the sky. Feature launched in March 2015.

Watch video > <https://www.youtube.com/embed/fC-9FkBy2KA>

User-created 3D routes. Users can ride on routes made by other users or they can create their own 3D routes by just uploading the data for their routes in .gpx format.

Voice chat. The multiple riders on a simulator route can chat with one another as they pedal, no matter where in the world they are.

Messages on the road. Curious onlookers can watch cyclists ride and send them messages of encouragement, which will appear written on the road on the simulator, where the riders can see them in real time.
