DUAL FINISH — Cold-forged Chrome Vanadium steel sockets, hardened and tempered for added strength. Half chrome and half satin finish with knurled ring for extra grip with oily fingers.

MIRROR FINISH — Cold-forged Chrome Vanadium steel sockets, hardened and tempered for added strength. Fully polished finish with knurled ring for extra grip with oily fingers.

A-O 1/2"Sq Drive Socket Sets

Chrome Vanadium steel socket sets in carefully selected sizes. Hardened and tempered with chrome finish for corrosion resistance. All sockets include WallDrive® configuration giving an additional 30% more torque handling power than traditional sockets. Handles rounded fixings as well. Sets supplied on socket rail and backed by a lifetime guarantee*.

Gear-to-Gear ratchet head design is much stronger than traditional styles and offers up to 30% more torque.

WallDrive® sockets are designed to grip the flats of the fixing and not the corners. This allows up to 30% more torque to be applied to the fixing than traditional hex sockets, without causing damage. WallDrive® sockets can grip fasteners with rounded-off and damaged corners too.

Ratchet Wrenches

Gear-to-Gear ratchet head design is much stronger than traditional styles and offers up to 30% more torque.

WallDrive® sockets are designed to grip the flats of the fixing and not the corners. This allows up to 30% more torque to be applied to the fixing than traditional hex sockets, without causing damage. WallDrive® sockets can grip fasteners with rounded-off and damaged corners too.

Power Speed Ratchets

Sealey Speed Ratchets combine the high torque of traditional hand ratchets with the faster efficiency of an electric power tool, providing working speeds that are 10-20 times quicker when tightening/loosening fasteners. A no-load speed of 200rpm saves the time and fatigue of traditional hand ratchet wrenches. The clutch mechanism is designed so that when the maximum torque is reached (1Nm/0.74ft/lb) a tactile vibration indicates to change over to manual mode for continued tightening or loosening of fasteners. A fully rechargeable lithium-ion battery is included which can be recharged in just 45 minutes, and is fully protected from the overcharge, over-discharge or overheating. Ultra-smooth 60-tooth ratchet action, twist-reverse and quick release with spring-ball socket retention, power button with LED indicator and locking switch. Both ratchets are fitted with a contoured, soft grip handle and are supplied, with an AC adaptor, charging base, magnetic socket insert set and storage case.

Impact Sockets

Our Premier series of high quality impact sockets is one of the most comprehensive ranges available to the automotive technician. All sockets are manufactured from the very highest quality materials, with either manganese phosphate or electrodeposition finish for corrosion resistance. Chrome Vanadium steel used on 3/8" and 1/2"Sq drive sockets. Chrome Molybdenum steel used on 3/4" and 1"Sq drive sockets. All models are supplied in storage case or tray and are suitable for use with air/electric impact guns and ratchet wrenches.

WallDrive® sockets are designed to grip the flats of the fixing and not the corners. This allows up to 30% more torque to be applied without causing damage. WallDrive® sockets can grip fasteners with rounded-off and damaged corners too.

LIFETIME GUARANTEE*

All Premier and Siegen Hand Tools are covered by a no-quibble lifetime guarantee* against manufacturing defects.

Non-Sparking Spanners

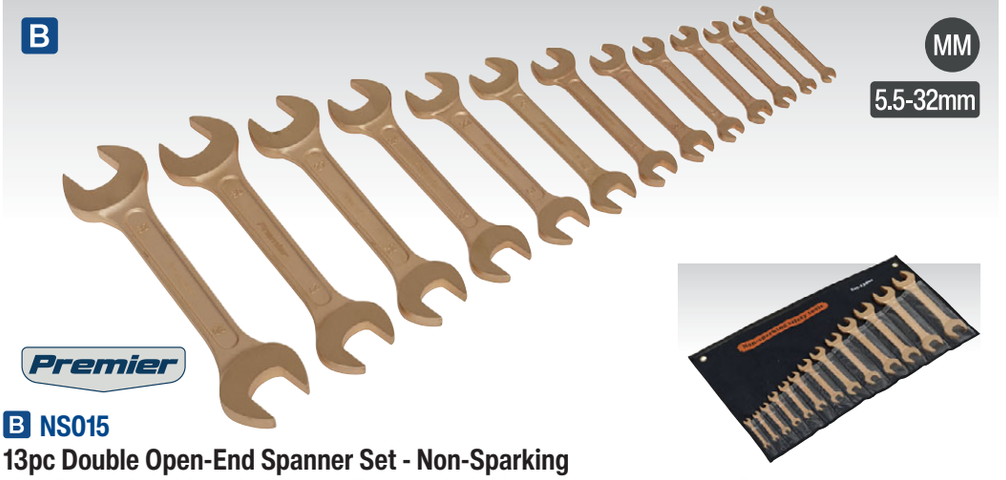

The Sealey range of Non-Sparking safety tools are intended for use in potentially explosive environments where accidental sparks can be created if regular steel tools are used. The risk of fire or possible explosion is caused by the presence of combustible or flammable vapours and liquids. Non-Sparking tools are essential in a wide range of industries such as oil and gas, petro-chemical plants, mining, marine, the armed forces or any other similar location where these risks are present. Manufactured from Beryllium Copper, heat treated and hardened to 30-39HRC. Special care and attention should be taken when maintaining Non-Sparking tools. Keep clean and free from ferrous and other contaminants which may impede the spark resistant properties of the tool.

Beryllium Copper
Beryllium copper is non-sparking but physically tough and non-magnetic, meeting the requirements of ATEX directive for Zones 0, 1 and 2. Beryllium copper hand tools are ideal for use in environments at risk of explosive hazards, such as oil rigs, coal mines, and grain elevators. Beryllium copper is resistant to non-oxidizing acids such as hydrochloric acid and carbonic acid, to plastic decomposition products, abrasive wear and to galling. It can be heat-treated for increased strength, durability, and electrical conductivity.

VEHICLE SUPPORT & AXLE STANDS IMPORTANT SAFETY WARNING!

WHEN JACKING A VEHICLE ALWAYS USE AXLE STANDS AND CHOCKS. NEVER GET UNDER A VEHICLE SUPPORTED ONLY BY A JACK.

1. Axle Stands and High Level Vehicle Supports are capacity rated individually. Axle stands are sold in pairs and High Level Vehicle Supports are sold singly. A pair will normally support double the rated single load but be aware - you may know the total weight of the load you are supporting, but you cannot be sure that the load weight is spread evenly across both stands. For this reason always use higher capacity stands than you think you need.

PLEASE BE AWARE THAT SOME SUPPLIERS MARKET CAPACITY PER PAIR RATHER THAN INDIVIDUALLY WHICH CAN BE MISLEADING.

2. Axle Stands and Vehicle Supports are designed to support a static load in the middle of the engagement head (crutch). Take care to load evenly and never on the edge of the engagement head. Always take steps to ensure the load cannot move, use wheel chocks (see page 302 to 303), apply vehicle brake and put in gear or "park".

3. All the Axle Stands and Supports in this catalogue are designed for professional use and tested to ensure they meet or exceed International Standards.

AXLE STANDS
IMPORTANT SAFETY WARNING!
WHEN JACKING A VEHICLE ALWAYS USE AXLE STANDS AND CHOCKS. NEVER GET UNDER A VEHICLE SUPPORTED ONLY BY A JACK.
Axle Stands are capacity rated individually. Axle stands are sold in pairs. A pair will normally support double the rated single load but be aware - you may know the total weight of the load you are supporting, but you cannot be sure that the load weight is spread evenly across both stands. For this reason always use higher capacity stands than you think you need.

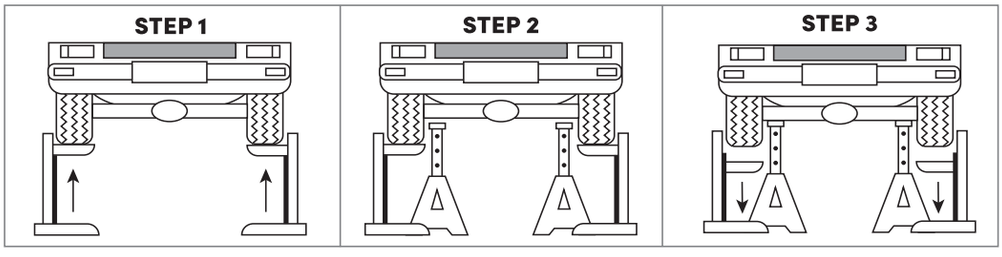

Sold as singles, but must be used in pairs.

Model No's ASC50, ASC70 and ASC120 are all supplied with three different styles of crutch.

Follow these steps when using these stands and ensure adequate number of stands are used to fully support the load.

Quick Lift Vertical Transmission Jacks

These transmission jacks feature Quick Lift to reduce the time and effort needed to get saddle to gearbox. Single foot pedal operation keeps hands-free during lifting process. Spring loaded dead man's safety release control reduces the risk of inadvertent lowering. 2-Way hydraulic unit ensures that the saddle lowers at a controlled speed at all times, even without load. Saddle is reversible allowing a jack pad to be fitted to support items other than transmissions. Castors and side handle make these units easily manoeuvrable. Hydraulic units larger than the economy models for improved performance and durability. Can be fitted with optional Adjustable Gearbox Support - check specification in table.

HYDAULIC PRESSES

The most comprehensive range of Presses in the UK. All Sealey Presses are designed for the professional user in a demanding workshop environment. Regardless of application or budget, we have a press to suit your requirements. With so many different features and benefits to consider, we have put together a simple guide to help you choose the right model. Look out for the following logos alongside each model.

Premier / VIKING — Our top-of-the-range presses featuring heavy-duty frames with ram assemblies that can slide left or right allowing greater flexibility. Our Premier and Viking presses are covered by a 5 Year guarantee*.

Hydraulic — Manual hydraulic pump and ram. Some models have a detachable pump and ram allowing hydraulics to be used for other purposes when the press is not in use.

AIR Hydraulic — Hydraulic ram powered by pump that can be operated manually or with the aid of an air operated motor.

FOOT PUMP — Hand or foot pedal operation. Using foot pedal to operate keeps hands-free for fine positioning of the workpiece before pressing starts.

Sliding Ram — Sliding ram assemblies allow you to position the ram for pressing non-central objects on the workpiece. See sliding ram travel figures in specification tables.

CC230V - HHO ENGINE CARBON CLEANER

Carbon build-up is becoming a huge issue, not only in diesel engines but also in modern petrol engines. It can make the engine work much harder, increasing chance of engine faults or even failure, increased emissions and even fuel consumption. Oxyhydrogen is created by the electrolysis of water which also has potassium hydroxide added to catalyse this process. When fed into the air inlet of a running vehicle, it will increase the temperature within the combustion chamber and remove excess carbon build-up, giving you a thorough internal clean. Immediate results are noticeable and the feedback we have seen is overwhelming. This procedure doesn't even take a technician away from another job as you can leave it in a well-ventilated area working its magic. Garages are already starting to invest in this technology to increase revenue of up to £99.00+VAT per job, which can take anywhere up to an hour, depending on the severity and engine size. With no expensive additives needed, the running costs are practically nil, giving the potential to earn 100% profit on every job!

This diagram illustrates which components benefit from the HHO decarbonising process.

A CC230V

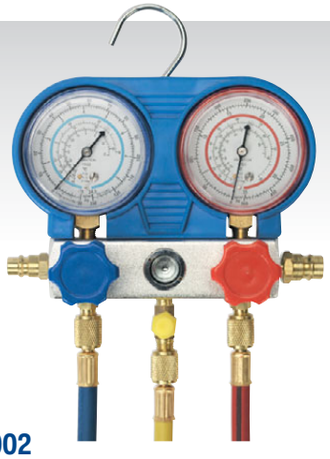

HHO Engine Carbon Cleaner 230V

The Sealey CC230V uses cutting edge HHO engine cleaning technology. Each unit uses electrolysis to split water molecules into the composite elements of oxygen and hydrogen to produce oxyhydrogen or HHO gas. This simple-to-use machine feeds HHO into the engine through the vehicle air inlet, breaking down any carbon build-up on its way. Carbon builds up layer-on-layer when fuel combusts in the engine cylinders which can affect the smooth running of any engine. Removing carbon build-up from the engine can improve performance, raise mpg, reduce emissions and oil consumption. The CC230V runs on tap water with no expensive refills making the process a great revenue boost for any workshop. Fitted with CAMS (Charge Activated Machine Shutdown) designed to safely cut-out if the engine stops running during treatment. This meaning the unit can be left to run without supervision, allowing the user to continue with other work.

IMPORTANT INFORMATION
It is advised not to use an exhaust fume extractor when conducting a force regeneration on a vehicle fitted with a DPF (Diesel Particulate Filter) because of high temperatures from the exhaust. These high temperatures may melt the rubber exhaust cones or pipes on the fume extractor. Regeneration should be conducted outside in a well-ventilated area away from buildings or other vehicles.

DPF1 – DPF ULTRA CLEANING STATION

Blocked DPF 's have been a massive issue for many years. Blockages are mainly due to the vehicle not meeting the regeneration process criteria, predominantly caused by short journeys etc. Buying a new DPF can be very costly and sending the old one away for cleaning can also be a time consuming process. With this machine, the garage is able to offer a professional, fast turnaround vehicle ultra-cleaning solution at a fraction of the cost. Each treatment will require a DPF1KIT (2-Stage additives). Stage 1 is an ultra-cleaning chemical which is poured into the DPF and left to soak for up to 1 hour and has been specially designed to lift any impurities. This is then emptied and the DPF is strapped down to the cleaning bay and a mixture of high air pressure and water is forced through in stages over a period of time, until the water coming out is crystal clear! After this process is complete, it is time for Stage 2, which involves a protective chemical poured through to coat the inside. DPF, assisting in the prevention of further soot build-up, which could then lead to a blockage. This can then be put straight back onto the vehicle again giving the garage a great new revenue stream and further satisfied customers. Garages are already reaping the benefits of these cleaning stations, charging upwards of £250+VAT.

Each treatment will require a DPF Ultra Cleaning Kit (Model No. DPF1KIT) which includes 1 x Ultra Clean and 1 x Ultra Protect Solution. The ultra cleaning chemical is a unique solution specially formulated to safely lift impurities from the DPF. The protect solution features the latest nano-catalyst technology to keep your DPF cleaner for longer. Also features an automatic service function allowing the user to continue with other work.

The Sealey Buying Guide to Battery Chargers

Sealey offer an extensive range of chargers to suit both professional and home users too. This guide is designed to help you choose the right machine to suit your needs.

Manual Transformer Chargers

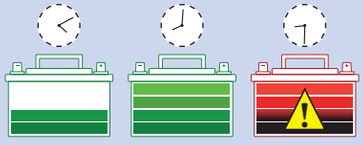

Basic transformer chargers which are manually operated and suitable for wet flooded or VRLA batteries only. Not suitable for use on AGM or EFB batteries.

Manual transformer chargers have the ability to charge a battery from a low voltage to fully charged status. This can take anything from 6 to 24 hours, depending on the level of discharge.

Some models are also equipped with an additional "Engine Starter" function. This function is typically found on larger, heavy-duty chargers and allows the user to jump start a vehicle with a discharged battery.

The user needs to decide the level of charge to be applied, monitor the charge status regularly and turn off the charger when the battery is fully charged.

Failure to turn off the charger once the battery is fully charged, could result in permanent damage to battery and in extreme cases, the battery could explode.

Automatic Smart Chargers

These are often referred to as smart chargers or trickle chargers and utilise electronic circuitry and microchips, that automatically assess the condition of a battery. They then apply the ideal level of charge to optimise the charging procedure, resulting in a faster, more efficient charge. When the battery is fully charged, they revert to a maintenance mode, to keep the battery in a fully charged state. Therefore, there is no risk of damage to the battery.

In maintenance mode the charger will continually monitor and charge the battery as required over extended periods of time.

Other features on the Automatic Smart Chargers are as follows:

Some models in the Sealey range are also suitable for charging and maintaining modern lithium vehicle batteries.

Certain models also include a desulphation function. Sulphation occurs naturally in batteries. Over time it builds up on the battery's internal lead plates, reducing their efficiency and the lifespan of the battery.

The desulphation function creates a pulsed charge, which cleans off the sulphation, look out for the desulphation battery icon as shown right.

Vehicles that utilise "Stop Start" technology may require Smart Chargers to charge their batteries.

Additional Functions

Engine Starter Function

This function is typically found on larger, heavy-duty chargers and provides a high amp boost, which allows you to jump start a vehicle with a discharged battery. They work by transferring power directly from the internal transformer to a vehicle's discharged battery. The jump starter function will not charge your battery, but instead provides the necessary power to crank the engine and start the vehicle. Once the engine is on, the alternator will charge the battery. The biggest advantage of portable jump starters is that they do not require the running of another vehicle and can be used by just one person.

Choosing The Correct Amperage

Now you've decided on the type of charger you need, there are a couple more points to consider. Bigger batteries require larger output chargers, therefore, you will need to choose a model capable of charging the largest battery you are likely to need to charge. Most chargers are suitable for charging Lead Acid Batteries, but not all are suitable for Gel, Calcium or AGM, EFB or Lithium batteries. Always refer to the battery manufacturer for specific charging instructions. Always refer to manufacturer's specific information prior to charging.

Battery Support Units

A Battery Support Unit (BSU) is an essential piece of equipment for any workshop wanting to carry out diagnostic work, ECU programming or software updates to a car's electronics.

In fact, a Battery Support Unit is a valuable tool for all forms of modern vehicle servicing.

A BSU will supply a stable, higher than required voltage, whilst protecting vital components from damage throughout the programming or diagnostic process.

Why is this Important?

An ECU factory reprogram can take up to 14 hours (some vehicles may take longer). This is normally carried out overnight with the vehicle ignition off. The factory control program will access the vehicle systems and power these up as required to test and reprogram each control module. During this process it is imperative that the voltage supply to the vehicle is maintained.

If unsupported, as the battery voltage starts to drop, the vehicle will automatically shut down modules to ensure power can be saved to start and run the vehicle. This could lead to a situation where the diagnostic tool is unable to access the vehicle control modules to upload the software which could possibly disable the vehicle. Even a slight dip in voltage can cause modules to shutdown.

Our range of Battery Support Units cater for wide variety of batteries from, 20A to 100A power supply capability. The ECS models also have vehicle start facilities to start a vehicle with a flat battery.

ElectroStart® Batteryless Jump Starters

Vehicle jump starting made easy with innovative technology, which unlike traditional boosters does not require an internal battery. Simply connect to a flat vehicle battery and the unit will draw power from it and energise itself fully in a matter of minutes. It then pushes full power safely back through the starting system, jump starting the vehicle. If the vehicle battery is faulty or is holding less than 5 volts the ElectroStart® can be pre-charged via another vehicle's battery, a Micro USB charging cable (not included) or the 12V accessory lead. No internal battery means no storage issues. Compact and lightweight for easier handling and storage, yet still delivers the same result as heavy, bulky, lead acid battery equivalents. Ideal for both professional mechanics and home use.

RoadStart® Emergency Jump Starters

These devices can be carried as easily as a briefcase, yet deliver enough power to start up to 30 vehicles, dependent on specification and size of engine.

The strength of these products lies in the choice and development of the integral battery. The batteries are selected for their cyclic efficiency - their ability to accept, store and release charge time after time and our battery program is among the best on the market.

RoadStart® units may also be used to power 12V DC items such as lighting or tools, using the integral vehicle accessory socket. The RoadStart® units can also be used to retain the memory codes on car radios and alarms whilst the main battery is disconnected.

Vacuum Oil & Fluid Extractors

Vacuum Oil and Fluid extractors assist in removing used oil and fluids from a vehicle. They are designed in general to remove used engine oil via the dipstick tube or oil service pipe in newer vehicles, thus avoiding the need to remove engine sump plugs and remove oil by gravity into an oil drainer. By using a vacuum extractor this avoids a lot of mess and the need to elevate the vehicle to gain access to the sump plug. After inserting the suction probe into the dipstick tube, the extractor creates a vacuum, either by pumping manually or by the aid of an air compressor on certain models. Once a vacuum has been created the used oil is sucked up into the extractors container. Choosing the right extractor will depend on the intended use, such as reservoir size required, probe sizes and accessories or the use of manual, air or electricity.

IMPORTANT
Model No. AK450DX cannot be used unless a pump-away station is purchased. One pump unit can only be used to empty one drainer at a time, although the time taken to empty the reservoir is short. It is usual for operators to purchase one pump-away station and several oil drainers. Model No. AK450DP is supplied with its own filter, regulator and lubricator to ensure trouble-free operation.

AIR DISCHARGE
The drainer uses a blanket of air to squeeze the oil out of the reservoir. These units are not suitable for connection to a closed system and are not covered by regulations requiring regular pressure testing.

PROBE SUCTION
These units are supplied with a variety of suction probes which can be used to extract warm oil from the sump through the dipstick tube.

AIR DISCHARGE
Model No. AK450DX is fitted with a Dry-Fit Coupling. In order to discharge the drainers they must be connected to a pump-away station which is sold separately. See Model No. AK450DP.

European Standard EN12941

EN 12941 is the European standard for a complete powered air filtering device incorporating a face helmet or visor. This standard outlines three classes of performance, which define the following maximum levels of inward leakage*:

10% for TH1

2% for TH2

0.2% for TH3

**Inward leakage estimates the performance of a respiratory device by measuring contaminants that leak through a respirator from various sources, including filter penetration, face seals, valves and gaskets.*

A **PWH615** meets Class TH3.
B **PWH616** meets Class TH1.
C **PWH617** meets Class TH2.

Welding Helmets with EN 12941 Powered Air Purifying Respirators (PAPR)

PAPR (Powered Air Purifying Respirator) systems with auto darkening welding helmets. Lithium battery powered respirator units provide the user with a constant filtered stream of air to their head and face. The filters are designed to reduce or remove dust and particles but not vapours and gases. The kits meet relevant "TH" classes of EN 12941:1998/A2:2008 (see right). Suitable for MIG, TIG MMA/ARC welding, cutting and grinding. Model No. PWH616 features an inner hood with protective clear visor. Complies with BS EN379, EN175, EN166 (Model No. PWH616 only), EN12941 and DIN standards.

COMPRESSOR
BUYING GUIDE

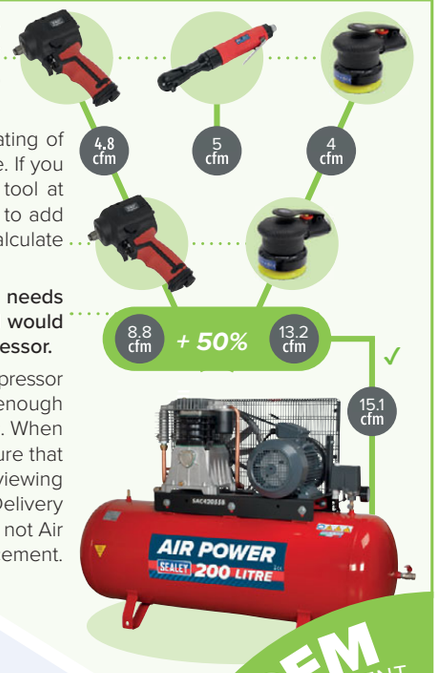

OUTPUT

The cfm rating of each air tool defines the amount of air required to power the tool in cubic feet per minute.

Determine the highest cfm rating of the air tools you intend to use. If you intend using more than one tool at the same time, you will need to add the ratings of both tools to calculate the total cfm rating.

A 50% safety margin then needs to be added e.g. a 4cfm tool would require a 6cfm output compressor.

Now you can look for the compressor that produces a high enough cfm output for your needs. When comparing models, ensure that you are reviewing the Free Air Delivery and not Air Displacement.

CFM REQUIREMENT

AMOUNT OF USAGE

Compressors need to cool down between regeneration periods. Regeneration is when the pump replaces the air that has been used from the compressor's air tank.

TANK SIZE

The size of the tank will determine how long you can use your air tools before needing to let the tank fill up again.

A longer job, such as sanding will require a larger compressor. Using a 4cfm sander will require a compressor with a minimum Free Air Delivery of 6cfm.

An air tool requiring a higher air output will drain the tank quicker, so the size you need depends on the job at hand and how long the task will take.

RECEIVER CAPACITY

ELECTRIC OR PETROL DRIVEN

If you plan to use the compressor where there is no electrical supply, you will need to opt for a petrol model.

If choosing electric, ensure your power supply is adequate to run the compressor. Some larger compressors cannot be run from a 13A socket.

SUPPLY

HORSEPOWER

1.5hp | 2hp | 3hp | 5.5hp | 6.5hp | 7.5hp

The compressor's horsepower, typically rated between 1.5 and 7.5, measures the amount of work an engine can perform.

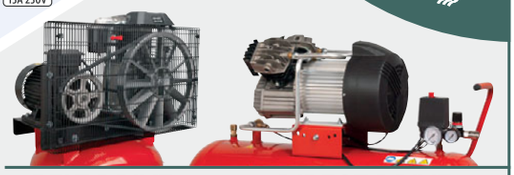

The higher the horsepower, the quicker the air is replaced in the air tank.

This will allow less downtime between each job. It also allows the motor to work for shorter periods of time.

NOISE

BELT DRIVE ***DIRECT DRIVE***

Belt driven machines are quieter than direct drive versions, but some compressors have noise suppressing casings to reduce noise pollution. Low noise compressors allow use indoors and enable closer proximity to the unit.

LOW NOISE COMPRESSOR

ACCESSORIES

AIR HOSE REEL

Air hoses or reels will help the delivery of air to your tools. Different air line couplings may be required to allow the maximum potential from your air tools and to permit the use of multiple air lines from your compressor.

AIR COUPLINGS

FILTER/REGULATOR/ LUBRICATOR

To deliver consistent pressure to an air tool or water trap, a regulator should be fitted in the air line. A lubricator or air filter may be worth investing in, depending on the application. Although, you must ensure that all accessories match the specifications of the compressor being purchased.

AIR ACCESSORIES

OIL LUBRICATED OR OIL FREE

Oil free compressors need less maintenance and have lower running costs than models which require oil to operate. An oil free compressor is also essential for applications where oil contaminants are prohibited. An oil lubricated compressor can have a longer life, due to less friction and wear within the unit, and is suitable for running standard air tools.

WE STOCK A WIDE RANGE OF COMPRESSOR OIL.

Speedfit® Air Supply Ring Main System

Install your own workshop compressed air ring main quickly, easily and competitively with this compressed air system (CAS).

A complete professional compressed air system can be installed quickly and easily, considerably reducing the need for specialist staff. Avoids extensive disruption and downtime.

Lightweight yet strong acetal copolymer fittings and nylon pipe runs, make handling and assembling the system far easier than an equivalent system in galvanized steel.

- ✔Quick to install.
- ✔Safe, secure and leak-proof.
- ✔Simple to reconfigure.
- ✔Lightweight and easy to handle.
- ✔Corrosion resistant and maintenance-free.

Simple push action pipe fittings do away with preparing threaded tubes or applying solvents. Complex pipe and fitting configurations are also assembled more rapidly since the fittings can be disassembled and reconfigured quickly.

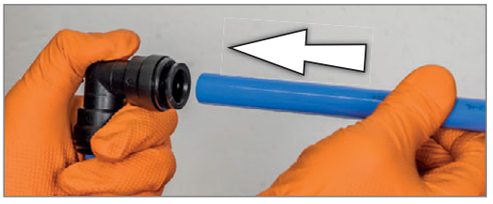

Installation Guidelines

For a comprehensive set of installation guidelines and recommendations, call or email our technical department on 01284 757505, technical@sealey.co.uk, or visit our website www.sealey.co.uk. As with all installation work a certain level of technical competence is required. Refer to 'Approved Code of Practice - Safety of Pressure Systems' available from HMSO.

Simple to Assemble

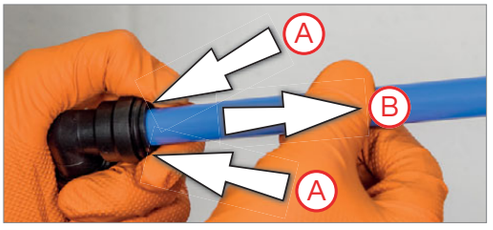

1. Cut pipe to size.

2. Push firmly into chosen fitting.

3. Pull on pipe to check secure.

To disconnect, depressurize system, push collet into base of fitting (A) and remove pipe (B). The fitting and pipe may be reused.

Illustration purposes only.

Important!
The Speedfit® system must not be used with explosive gases, petroleum spirits or other fuels. It is also not suitable for central heating systems.

System can be connected to existing ring main even if made of galvanized steel.

Technical Specification

Working Temperature Range:	-20 to +70°C

The above specification refers to use with compressed air.

Working Pressure

This system is suitable for the following temperatures and pressures:

Temperature:	Pressure:
+23°C:	10bar
+70°C:	7bar

The above ratings are for air. For use with other fluids or at other temperatures and pressures please consult our technical sales department.

Pipe Types

These fittings are intended for use with Sealey nylon pipe but are also suitable for use with a wide range of plastic and soft metal pipes including UPVC, ABS, polyethylene, nylon, mild steel and copper to the tolerances set out below. Soft plastic pipe, such as nylon, should have a minimum wall thickness of 1.5mm. The pipe should have a good quality surface and be damage-free.

Pipe Tolerances

These fittings are intended for pipes with outside diameters to the following tolerances:

Size:	Ø15, 22 & 28mm OD
Tolerance:	+0.05 to -0.10mm OD

Torque Values

The following maximum torque values should be applied:

Size:	1/2"	3/4"	1"
Plastic Threads:	3Nm	4Nm	n/a
Metal Threads:	4Nm	5Nm	5Nm

Material Specification

The fittings are made up of three components: Bodies are produced in strong engineering plastic or in brass. O-Rings are nitrile rubber. Collets are produced in acetal copolymer with stainless steel teeth.

Applications

Pipe and fittings should be kept clean and undamaged before use. These products are designed for use with air. For other applications please contact our technical sales department.

BRANDS EXPLAINED

Premier

Our Premier range offers superb performance while still being competitively priced. Premier Air Tools are made up of the very highest quality components and manufacturing designs to offer a long and durable working life. As with all of our ranges, Premier Air Tools are backed with unrivalled and extensive aftersales care including a 3 year guarantee.

Generation

These tools feature contoured, soft grip handles and housings which help reduce the effects of vibration and chill - major contributors to circulatory and nerve problems such as Raynard's Phenomenon, also referred to as "white finger". The tools also include exhaust systems designed to reduce noise levels by baffling the noise or directing it away from the operator's environment.

Siegen

Offering impressive reliability and exceptional value for money. Our Siegen range is backed up with the same professional aftersales service as the Sealey and Premier ranges.

SEALEY

Our Sealey range is defined by traditional designs and proven workshop reliability. Our core range, trusted for over 40 years, is one of the UK's market leaders in tools and equipment.

Our Torque Specifications

In order to clarify the torque characteristics of these tools, we quote two figures:

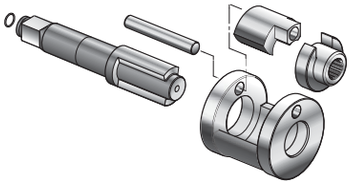

Fastening Torque
The maximum torque figures are those developed by tightening a bolt.

Breakaway Torque
The breakaway torque is the highest bolt torque that the tool will undo within a reasonable time. It is not related to the torque to which the tool can tighten the bolt.

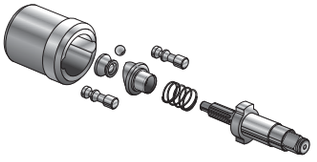

TORQUE TESTED
All our impact tools are thoroughly tested during the initial selection phase to ensure the power we quote is the power you get. Power output curves for all our impact tools are constructed so we can rate them for fastening and breakaway torque. We recommend the use of an air management system to protect the tools from dirt, rust and damage.

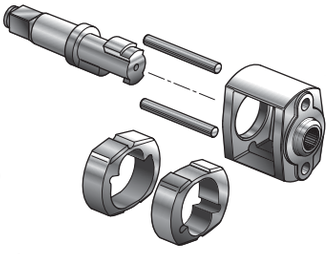

Which Drive Type?

Standard Hammer
Commonly referred to as 'rocking-dog' hammer. Combines simplicity of construction with high level of power output. Includes single hammer weight, counterbalanced with hammer dog. Ideal for price competitive workshop power tools.

Pin Clutch
Torque delivery of a pin clutch impact wrench is fast, steady and smooth. The clutch design also reduces vibration and noise levels. Pin clutch impact wrenches are recommended for prolonged usage with a preset air pressure supply. Always refer to the guns operating pressure before use and never exceed. Failure to do so may result in premature failure.

Twin Hammer
Twice the number of hammers, twice the hammer weight and therefore twice the energy per blow. Fast delivery of raw power with the bulletproof reliability of a standard hammer mechanism. Ideal for heavy hitting power in the tyre shop and workshop.

Double Straight Flute
Double flute allows faster swarf removal than a standard single flute found on cheaper alternatives.

Double Spiral Flute
Much like the double straight flutes, these offer faster swarf removal than a standard single flute step drill. The two spiral flutes offer even greater efficiency, which in turn helps to keep the temperature down, resulting in a longer life expectancy of the tool.

M2 Steel
Our M2 metal step drills are more durable and longer lasting than standard 4341 steel and cheaper versions that you may see elsewhere. As well as lasting longer, they also cut through tougher materials with less effort and more efficiency.

118° Split Point Drill Bits

118° Point angles are used primarily in softer materials such as mild steels and cast irons. 135° Split point should be used to cut harder steel materials.

135° Split Point Drill Bits

135° Split Point

With a 135° drill point, you get thicker chips which allows holes to be drilled faster especially when coupled with HSS fully ground off cobalt drill bits. The length of the lips on a 135° point drill, measured from axis to the outer corners, is relatively short. This enables quicker penetration into the workpiece and reduces thrust and abrasion along the cutting edges.

Roll Forged Drill Bits

Entry level drills with 118° tips are ideal for use on softer materials such as mild steel. These drills are perfect for occasional use.

Fully Ground Drill Bits

These are higher quality than roll forged drill bits, featuring 135° tips which allow holes to be drilled faster. Longer lasting and ideal for regular use.

Cobalt Drill Bits

Cobalt drills are much stronger and hard wearing than standard drill bits meaning that they will also last much longer. As well as being stronger than other drill bits, they are able to cut through hardened materials such as cast iron and stainless steel. Cobalt drill bits are our highest quality drill bit and will outlast both roll forged and fully ground versions.

Hex Shank

Hex shank drill bits are ideal for when you need to change between multiple drill bits quickly and saves the need to constantly have to loosen and re-tighten your chuck. The shape of these drill bits also means that you get more grip, making these perfect for use on harder materials. Always make sure that the bit has been fully tightened before use to ensure that it drills straight or else it may cause breakage.

Ø6mm Shank

These are the most common sizes of drill bits found on the market and offer incredible reliability. They have a Ø6mm diameter and will fit into most hand and pillar drills.

118° Split Point Drill Bits

118° Point angles are used primarily in softer materials such as mild steels and cast irons. 135° Split point drills should be used to cut harder steel materials.

SEGMENTED BLADES

The slots on segmented blades help to improve the flow of air to the blade, which in turn keeps the temperature down and increases the life of the blade. There are various types of shapes and sizes of segments, which lend themselves to the cutting of different materials.

TURBO BLADES

With their continuous rim and serrated edge, these blades are intended to give faster cutting speeds, yet still maintaining a smooth cut. These blades are suitable for normal angle grinders and circular saws and are designed to cut through the toughest of materials.

HOT PRESSED

Hot Pressed

These diamond discs have an extra process in their manufacturing cycle to help improve their hardness. These discs cost slightly more, but have a longer lifespan than standard, cold pressed discs.

LASER WELDED

Laser Welded

Laser welded discs are designed to withstand higher temperatures, which in turn improves the life of the disc and also allows for cutting of harder materials without any issues. Laser welded segments are also generally larger and therefore last longer.

SEGMENT LENGTH

Segment Length

When comparing quality levels of diamond disc, it is always important to check the segment length. Generally, the larger the segment length, the more cutting life the disc will have.

ADVANTAGES

Advantages of Diamond Blades

Diamond blades create a cleaner cut than standard cutting discs and are safer to use. They are longer lasting and therefore more economical over time.

Vice Materials Explained

Our range of vices are manufactured from a variety of different materials. Each material has its own advantages making them suitable for different applications, though all are suitable for general purpose use.

STEEL
- Steel has low damping capacity but is more malleable and less brittle than iron, meaning that it can handle higher tensile stresses.
- All steel vices are the most suitable for high impact use.

CAST IRON
- Cast iron has strength under pressure and high shock-absorbing capabilities.
- Cast iron vices are suitable for frequent use.

SG IRON
- SG (spheroidal graphite) iron, also known as ductile iron, is a graphite rich cast iron.
- Defined by its superior impact and fatigue resistance meaning that it is less brittle and suitable for heavy workshop use.

European Standard EN12941

EN 12941 is the European standard for a complete powered air filtering device incorporating a face helmet or visor. This standard outlines three classes of performance, which define the following maximum levels of inward leakage*:

10% for TH1

2% for TH2

0.2% for TH3

**Inward leakage estimates the performance of a respiratory device by measuring contaminants that leak through a respirator from various sources, including filter penetration, face seals, valves and gaskets.*

A **PWH615** meets Class TH3.
B **PWH616** meets Class TH1.
C **PWH617** meets Class TH2.

The Health and Safety (Safety Signs & Signals) Regulations 1996 require employers to provide and maintain safety signs where there is significant risk to health and safety that has not been avoided or controlled by other means (e.g. safe systems of work) provided that the use of a sign can help reduce the risk. ISO 7010 was developed to provide consistency in design across the EU. All our signs are manufactured in compliance with BS EN ISO 7010 standards.

The use of symbols and graphical images is a simple safety system used to convey safety messages at a glance. Colours and symbols, appropriately used, provide information and warnings of hazards which are essential to personal safety. Safety signs are categorised by five main sections: Hazard, Mandatory, Safety, Prohibition and Fire Equipment. Available individually or in packs of 10, in a variety of materials.

IMPORTANT NOTE

There are three standards for ladders in the UK, Class 1, 2 and 3. EN 131 replaced BS 2037 Class 2. Confusion arises with the term 'duty rating', which British Standards arrive at through consideration of frequency and general conditions of use. For consistency we quote maximum static vertical load figures for all our ladders. We only offer trade and industrial ladders. See table to the right for clarification.

Class	Type	Standard	Max. Static Vertical Load	Duty Rating
Class 1	Industrial	BS 2037	175kg	130kg
Class 2	Trade	EN 131	150kg	n/a

New Workshop Designer

Visualise your dream workspace with our Workshop Designer

Construct your ideal workshop from our vast range of storage cabinets. The choice of units available and their modular design means they are fully customisable, providing you with the perfect storage solution. Available in three ranges, each of which allows you to purchase a single unit or create a complete storage system.

See Pages 1006-1008

See Pages 1009-1023

See Pages 1024-1031

How it works

Using our handy design tool, you can bring your workspace to life by creating the perfect combination of drawers, cabinets and back panels. The SuperlinePRO® and Premier™ ranges can be customised further by adding your choice of traditional pressed wood or contemporary stainless steel worktops.

Step 1.

Select your basic room shape to get started, then specify room dimensions on the next screen. Move windows and doors into the correct position.

Step 2.

Choose which storage range you want to kit out your workshop with, then drag and drop the units into the designer tool.

Step 3.

Review your design in 3D view, then once you're happy with the final design, save and finish to generate an itemised quote.
