

Improving multi-drug resistance TB care

DHIS 2 e-DR-TB

Management Information System

HISP Uganda is building an e-tracking system based on the DHIS 2 Tracker

"...the reasons why multidrug resistance continues to emerge and spread are mismanagement of TB treatment and person-to-person transmission. Most people with TB are cured by a strictly followed, six-month drug regimen that is provided to patients with support and supervision. Inappropriate or incorrect use of antimicrobial drugs, or use of ineffective formulations of drugs, and premature treatment interruption can cause drug resistance, which can then be transmitted."

WHO, Oct. 2015
