

Appropriate Assessment Determination in accordance with Regulation 42(11) of the European Communities (Birds and Natural Habitats) Regulations 2011 – 2015

Flood Risk Management Plan for the LAUNE – MAINE – DINGLE BAY River Basin (UoM22)

[1.] Legislative Context

The Habitats Directive (92/43/EEC) seeks to conserve natural habitats and wild fauna and flora by the designation of Special Areas of Conservation (SACs). SACs are selected for the conservation of Annex I habitats (including priority types which are in danger of disappearance) and Annex II species (other than birds). The Birds Directive (79/409/EEC) seeks to protect birds of special importance by the classification of Special Protection Areas (SPAs). SPAs are selected for the conservation of Annex I birds and other regularly occurring migratory birds and their habitats. The annexed habitats and species for which each site is selected correspond to the qualifying interests of the site; from these the conservation objectives of the site are derived. SACs and SPAs comprise the Natura 2000 network and are also known as European sites.

An Appropriate Assessment (AA) is required under Article 6 of the Habitats Directive where a project or Plan, which is not directly connected with or necessary to the management of the site, may give rise to significant effects upon a Natura 2000 Site.

Article 6(3)

Any Plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other Plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the Plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

Article 6(4)

If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a Plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted. Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.

The above requirement for AA has been implemented in Ireland by the European Communities (Birds and Natural Habitats) Regulations 2011-2015 (the 'Habitats' Regulations) and the Planning and Development Acts 2000-2017, as amended.

[2.] Description of the Flood Risk Management Plan

The Flood Risk Management Plan (the 'Plan') for the LAUNE – MAINE – DINGLE BAY River Basin (UoM22) has been prepared by the Office of Public Works in accordance with the European Communities (Flood Risk Assessment & Management) Regulations 2010 to 2015.

The purpose of the Plan is to set out the strategy, including a set of proposed measures, for the cost-effective and sustainable, long-term management of flood risk in the River Basin, including the areas where the flood risk has been determined as being potentially significant.

This Plan, which is for the period of 2018-2021, is one of 29 Plans being published; each setting out the feasible range of flood risk management measures proposed for their respective River Basins. The preparation of these Plans represents a significant milestone in the implementation of Government policy on flood risk management, as set out in the Report of the Flood Policy Review Group (OPW, 2004), and addresses Ireland's obligations under the 2007 EU 'Floods' Directive (EU, 2007/60/EC).

The Plan includes feasible measures developed through a range of programmes and policy initiatives including:

- Non-structural flood risk prevention and preparedness measures that are applicable nationally, aimed at reducing the impacts of flooding, that have been and are being developed to implement Government policy on flood risk management (OPW, 2004).
- Structural flood protection measures proposed for communities at significant flood risk, aimed at reducing the likelihood and/or degree of flooding, identified through the National Catchment Flood Risk Assessment and Management (CFRAM) Programme.

The CFRAM Programme has examined the flood risk, and possible measures to address the risk, in 300 communities throughout the country at potentially significant flood risk. These communities were identified through the Preliminary Flood Risk Assessment (PFRA - See Section 3 of the Plan), which was a national screening assessment of flood risk. The communities identified through the PFRA process as being at potentially significant flood risk in the LAUNE – MAINE – DINGLE BAY River Basin are set out in Section 3 of the Plan, along with the sources of flood risk that were deemed to be significant for each community. A set of flood maps, indicating the areas prone to flooding, has been developed and published for each of the communities.

The Plan builds on and supplements the national programme of flood protection works completed previously, that are under design and construction at this time or that have been set out through other projects or plans, and the ongoing maintenance of existing drainage and flood relief schemes.

A Strategic Environmental Assessment under the European Communities (Environmental Assessment of Certain Plans and Programmes) Regulations 2004, and an Appropriate Assessment under the European Communities (Birds and Natural Habitats) Regulations 2011-2015 where appropriate, have been undertaken as part of the preparation of, and have been published with, the Plan.

The overall objective of the Plan is to manage and reduce the potential consequences of flooding, recognising other benefits and effects across a broad range of sectors including human health, the environment, cultural heritage and economic activity, through viable flood protection schemes and other measures informed by a sound understanding of the flood risk established through the preparation of flood maps.

A nationally consistent set of specific objectives relating to each of these sectors was developed for the preparation of the Plans. These specific objectives and the importance given to each are listed in Section 1.4 of the Plan.

The Plan sets out the strategy, actions and measures that are considered to be the most appropriate at this stage of assessment and that are to an outline design and not at this point ready for construction (Section 1.5 and 6.1 of the Plan).

Further detailed design through a project-level of assessment will be required for such works before implementation, along with project-level environmental assessment and appraisal (including the consideration of alternatives), further public and stakeholder consultation and engagement and a statutory planning process (Section 1.5 of the Plan).

This assessment may give rise at that stage to some amendment of the proposed works to ensure that they are fully adapted, developed and appropriate within the local context, and that they are compliant with environmental legislation (Section 1.5 and 6.1 of the Plan).

The Plan will inform the progression of the preferred measures, but project-level assessments will need to be undertaken as appropriate under the relevant legislation for consenting to a Scheme or works that involve physical works and that may progress in the future. The approval / adoption of the Plan has not and does not confer approval or permission for the installation or construction of any physical works (Section 6.1 of the Plan).

The Plan will be reviewed by the Office of Public Works and other stakeholders by 2021.

[3.] Appropriate Assessment Process

3.1 Screening for Appropriate Assessment

This Flood Risk Management Plan is not considered to be directly connected with, or necessary to, the management of any designated sites (as identified in Section 1.5 of the Natura Impact Statement).

As such, a screening for appropriate assessment of the Plan was carried out in accordance with Regulation 42(1) of the European Communities (Birds and Natural Habitats) Regulations 2011-2015, to assess, in view of best scientific knowledge and in view of the conservation objectives of relevant European sites, if the Plan, individually or in combination with other Plans and projects, would be likely to have a significant effect on a European site. It was determined under Regulation 42(6) that an appropriate assessment was required as it could not be excluded that the Plan, individually or in combination with other Plans and projects, would have a significant effect on a European Sites. The Plan is considered to have the potential to have a significant effect on the European Sites, either individually or in combination with other Plans or projects, and is hence subject to appropriate assessment of its implications for relevant sites in view of those sites' conservation objectives.

The screening report for Appropriate Assessment was prepared by ecologists at Mott McDonald on behalf of the Office of Public Works. The screening report concluded that it could not be excluded, on the basis of objective scientific information following screening, that the implementation of certain measures would have a significant effect on the qualifying interests of the European Sites. Therefore, it was concluded that a Natura Impact Statement should be prepared and an Appropriate Assessment carried out.

3.2 How findings of the AA process influenced option appraisal & selection

As an integral part of the CFRAM Programme, all potential flood risk management measures were screened and, where appropriate, appraised in detail against a pre-defined set of objectives. One such objective was to support the objectives of the Habitats Directive (i.e. to avoid detrimental effects to, and where possible enhance, the Natura 2000 network, protected species and their key habitats, recognising relevant landscape features and stepping stones).

At the outset of the option appraisal, certain measures were immediately excluded from further consideration, on the basis that they would clearly have detrimental impacts on European Sites (which could not be mitigated), and there existed alternative solutions. The potential impacts of all other measures were next assessed to determine if there may be detrimental effects on the integrity of European Sites (without mitigation) and these measures were then scored and ranked using a system known as a Multi-Criteria Analysis (MCA) - a scoring system that takes account of all the defined objectives identified as being most important within each Community (e.g. the local economic activity, community facilities, infrastructure, the environment and the cultural heritage of the area). These included the Objective to support the objectives of the Habitats Directive, the scoring of which was informed by the analysis undertaken as part of the AA. The preferred option for managing the flood problems in each Community was identified using the MCA methodology described above as well as economic and environmental assessments, taking account of the opinion of the local community.

3.3 Natura Impact Statement

A Natura Impact Statement was prepared by Mott McDonald on behalf of the Office of Public Works, and was made available as part of the public consultation on the (draft) Flood Risk Management Plan from July to September 2016 on the OPW website (maps.opw.ie/FloodPlans/) and in hardcopy at the relevant Local Authority Offices on behalf of the Office of Public Works, in accordance with Regulations 18(1) and 18(2) of the European Communities (Assessment and Management of Flood Risks) Regulations 2010-2015.

The Natura Impact Assessment concluded (in Section 6) that “The NIS provides a complete, precise and scientifically robust assessment of possible impacts of the Flood Risk Management Plan (and progression of the preferred options for the AFAs within UoM 22), alone and in combination with other projects and plans, on the integrity of the Natura 2000 Network. Potential negative impacts on the Killarney National Park, Macgillycuddy's Reeks and Caragh River Catchment SAC have been identified due to the flood risk management measures proposed within the Killarney AFA. These impacts, in the absence of mitigation, would adversely affect the integrity of the Killarney National Park, Macgillycuddy's Reeks and Caragh River Catchment SAC by interfering with the factors (structures and functions) that support the achievement / maintenance of favourable conservation condition of the qualifying features of the SAC. Mitigation is prescribed to ensure that adverse effects on the integrity of the Killarney National Park, Macgillycuddy's Reeks and Caragh River Catchment SAC do not occur”.

3.4 Consultation

Further to the above-mentioned consultation, over 500 submissions were received in relation to the 29 Plans. These informed the finalisation of the Plans and Natura Impact Statements, and the SEA Statement summarises the influence of this consultation on the finalisation of the Plans.

Submissions from the Department of Culture, Heritage and the Gaeltacht, the Sustainable Water Network of Ireland (SWAN), Birdwatch Ireland and the Environmental Protection Agency were particularly relevant in respect of the Appropriate Assessment. A national summary of some of the main submission themes and how these influenced the final Plans is included in the 'Public Consultation on the Draft Flood Risk Management Plans: Summary Report' and the SEA Statement for this Plan details the influence of such submissions on this specific Plan.

3.5 Mitigation

Projects stemming from the Plan will apply a range of standard processes and measures that will mitigate potential environmental impacts. While the applicability of processes and particular measures will be dependent on the nature and scale of each project, examples of typical processes and measures that will be implemented where applicable at the different stages of project implementation are set out below.

Project Mitigation (Consenting Process):

The consenting process for the progression of measures involving physical works will require the applicable environmental assessments. Also, the consenting authorities may set out specific environmental conditions as part of the project approval.

Project Mitigation (Pre-construction / Design Stage):

For the detailed design of projects, where options are available, the design uses a hierarchy to mitigation measures along the following principles:

- Avoidance: avoid creating the potential impact where feasible.
- Mitigation: minimise the potential impact through mitigating measures
- Enhancement: Enhance the environment to better than pre-project conditions, where reasonably possible

The progression of a flood management project through the detailed design phase can entail a series of surveys to inform the design, where the scale of surveys would be proportionate to the complexity and potential impacts of the project. These can include:

- engineering structure surveys,
- topographical surveys,
- habitat & species surveys
- ornithological surveys,
- bat surveys,
- fish surveys,
- water quality surveys,
- archaeological surveys,
- landscape and visual assessments,
- land valuation surveys and
- other surveys as deemed necessary to prepare a project.

Where necessary, Wildlife Derogation Licences and Archaeological Licences will be sought from Department of Culture Heritage and the Gaeltacht.

The scope of the environmental impact assessment report (EIAR) for each flood management project, where required will include a hydro-morphological assessment to more clearly consider and support the Water Framework Directive 2000/60/EC (WFD) objectives.

The potential role for non-structural measures for each flood risk area, including natural type flood management measures will be examined in more detail and incorporated into the scheme design if deemed appropriate.

Project Mitigation (Construction Stage):

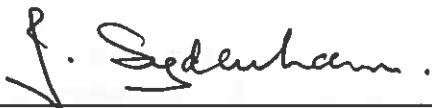

For large and complex projects and sites, where environmental management may entail multiple aspects, a project specific Construction Environmental Management Plan (CEMP) may be developed. This will form a framework for all environmental management processes, mitigation measures and monitoring and will include other environmental requirements such as invasive species management measures, if applicable. A designated environmental officer, project ecologist and project archaeologist will be appointed, as appropriate for the project.

[4.] Conclusion

An Appropriate Assessment has been carried out in accordance with Regulation 42(11) and 42(12) of the European Communities (Birds and Natural Habitat) Regulations 2011-2015 and has had regard to the findings of the Natura Impact Statement, the measures set out in the Flood Risk Management Plan, and the submissions and observations received on the (draft) flood Risk Management Plan. Noting that:

- approval of the Plan does not confer consent to the construction of any physical works;
- in respect of physical works / flood relief schemes, the Plan sets out only the recommendation to progress the project-level assessment and development (rather than the implementation) of Flood Relief Schemes, including environmental assessment as necessary and further public consultation, for refinement and preparation for Planning / Exhibition and, if and as appropriate, implementation;
- Measures have been identified that will mitigate potential environmental impacts at project level;
- Environmental Impact Assessment and Project-level Appropriate Assessment Screening and Appropriate Assessment must be undertaken in accordance with the relevant legislation where relevant as part of the consenting process for the progression of proposed measures that involve physical works;
- if the AA of a project at site level determines that adverse effects on the integrity of a European Site are likely, or cannot be ruled out, the project will not be pursued without an Assessment of Alternatives being undertaken to identify alternative options that would not lead to adverse effects on the integrity of any European Site. This would be undertaken prior to any further decisions on how to address the flood risk in the relevant area or prior to progressing to further stages of AA;

it has been concluded that the Flood Risk Management Plan for the LAUNE – MAINE – DINGLE BAY River Basin (UoM22) will not, either individually or in combination with other plans or projects, adversely affect the conservation objectives or integrity of any European Site.

For and on behalf of the Commissioners of Public Works
Thursday, 15th March, 2018.
