# **Care Quality Commission**

### **Inspection Evidence Table**

**GP Direct (1-590259277)** 

Inspection date: 30 September 2019

Date of data download: 30 September 2019

## **Overall rating: Safe**

Please note: Any Quality Outcomes Framework (QOF) data relates to 2017/18.

At the previous inspection on 9 August 2018, we rated the practice Requires Improvement for providing safe services. This was because:

- There was no clear system to monitor the stock levels and expiration of vaccines at the practice.
- There was no clear system to monitor blank prescription forms.

At this inspection, the practice is now rated Good for providing safe services.

## Safe Rating: Good

Appropriate and safe use of medicines

The practice had systems for the appropriate and safe use of medicines

Medicines management	Y/N/Partial
The practice ensured medicines were stored safely and securely with access restricted to authorised staff.	Υ
Blank prescriptions were kept securely and their use monitored in line with national guidance.	Υ
Vaccines were appropriately stored, monitored and transported in line with PHE guidance to ensure they remained safe and effective.	Y

#### Explanation of any answers and additional evidence:

 At the previous inspection in August 2018, the practice did not have a clear system to monitor stock levels and expiration of vaccines at the practice. At this inspection, we found this had improved. The stock sheet was clearly recorded and contained the required information such as, the order date and numbers. We found the stock balances were clearly recorded. There were initials recorded for staff checking the stock balances.

#### **Medicines management**

Y/N/Partial

 At the previous inspection in August 2018, we found there was no clear system to monitor blank prescriptions. At this inspection, we found this had improved; for example, there was now a date and time stamp and details of where the blank prescriptions were being distributed to within the practice. Staff members were required to email the practice manager regarding blank prescription numbers and where they had been distributed.

#### Notes: CQC GP Insight

GP Insight assesses a practice's data against all the other practices in England. We assess relative performance for the majority of indicators using a "z-score" (this tells us the number of standard deviations from the mean the data point is), giving us a statistical measurement of a practice's performance in relation to the England average. We highlight practices which significantly vary from the England average (in either a positive or negative direction). We consider that z-scores which are higher than +2 or lower than -2 are at significant levels, warranting further enquiry. Using this technique we can be 95% confident that the practices performance is genuinely different from the average. It is important to note that a number of factors can affect the Z score for a practice, for example a small denominator or the distribution of the data. This means that there will be cases where a practice's data looks quite different to the average, but still shows as no statistical variation, as we do not have enough confidence that the difference is genuine. There may also be cases where a practice's data looks similar across two indicators, but they are in different variation bands.

The percentage of practices which show variation depends on the distribution of the data for each indicator, but is typically around 10-15% of practices. The practices which are not showing significant statistical variation are labelled as no statistical variation to other practices.

N.B. Not all indicators in the evidence table are part of the GP insight set and those that aren't will not have a variation band.

The following language is used for showing variation:

Variation Bands	Z-score threshold
Significant variation (positive)	≤-3
Variation (positive)	>-3 and ≤-2
Tending towards variation (positive)	>-2 and ≤-1.5
No statistical variation	<1.5 and >-1.5
Tending towards variation (negative)	≥1.5 and <2
Variation (negative)	≥2 and <3
Significant variation (negative)	≥3

Note: for the following indicators the variation bands are different:

- Child Immunisation indicators. These are scored against the World Health Organisation target of 95% rather than the England average. Note that practices that have "Met 90% minimum" have not met the WHO target of 95%.
- The percentage of respondents to the GP patient survey who responded positively to how easy it was to get through to someone at their GP practice on the phone uses a rules based approach for scoring, due to the distribution of the data. This indicator does not have a CCG average.
- The percentage of women eligible for cervical cancer screening at a given point in time who were screened adequately within a specified period (within 3.5 years for women aged 25 to 49, and within 5.5 years for women aged 50 to 64). This indicator does not have a CCG average and is scored against the national target of 80%.

It is important to note that z-scores are not a judgement in themselves, but will prompt further enquiry, as part of our ongoing monitoring of GP practices.

Guidance and Frequently Asked Questions on GP Insight can be found on the following link: <a href="https://www.cqc.org.uk/guidance-providers/gps/how-we-monitor-qp-practices">https://www.cqc.org.uk/guidance-providers/gps/how-we-monitor-qp-practices</a>

Note: The CQC GP Evidence Table uses the most recent validated and publicly available data. In some cases at the time of inspection this data may be relatively old. If during the inspection the practice has provided any more recent data, this can be considered by the inspector. However, it should be noted that any data provided by the practice will be unvalidated and is not directly comparable to the published data. This has been taken into account during the inspection process.

#### Glossary of terms used in the data.

- COPD: Chronic Obstructive Pulmonary Disease
- PHE: Public Health England
- QOF: Quality and Outcomes Framework
- STAR-PU: Specific Therapeutic Group Age-sex weightings Related Prescribing Units. These weighting allow more accurate and meaningful
  comparisons within a specific therapeutic group by taking into account the types of people who will be receiving that treatment.
