Complete, inspired design solutions

Stretch Fabric Panels and Panel Systems are a suitable alternative to traditional acoustic panels. Sometimes it's more cost effective to install a large area on site than have prefabricated panels delivered and installed.

The Stretch Fabric Wall System consists of a plastic track, absorbent core and an acoustically suitable fabric finish. This may be Lucia or Clipso fabrics. The track is attached to the substrate, the acoustically absorbent core material is fixed between the tracks and the selected fabric is stretched over the assembly, held tightly in place by the track system. The edges of the fabric are hidden in the trim giving a clean, tidy and secure finish.

WHY USE SOUNDTRAC STRETCH FABRIC WALL SYSTEM?

Less damage – because of the nature of the Stretch Fabric system, the surface of the acoustic absorbent material is not 'visible'. This means that any knocks or bangs that the surface might endure will not leave the panels aesthetically damaged. If the surface fabric is damaged, it can be easily changed. Stretch fabric systems are ideal for sports halls, and if the high impact facing is used then the system can also be used as a pinnable surface.

BIGGER AREA PANELS – Traditional fabric wrapped acoustic panels are normally limited in size, typically 3m x 1.2m maximum. This means that when large areas need to be covered there may be seams and joints. By using a Stretch Fabric system, it is possible to make the panels up to 1.6m in one direction and much longer dimensions in the other.

ENVIRONMENT AND SUSTAINABILITY – As the system is self supporting, it allows us to use more environmentally friendly core materials such as recycled glass, recycled polyester, fiberglass made with natural binders and higher recycled glass content, recycled cotton and more. Fabrics can also be from recycled stock, making the Stretch Fabric System one of the most environmentally friendly acoustic systems available.

EASY TO FIT AROUND ARCHITECTURAL DESIGN – Due to the nature of the installation method used to fit Stretch Wall Systems, it is very easy to form shapes, curves and designs that traditional systems can't easily form

REDUCED MAINTENANCE – Due to the fabric being fitted into a plastic track system, the fabric can be removed and replaced, so damaged areas or a simple change of colour scheme is simple to do and far more cost effective than having to replace all panels. As the system goes directly to a wall or ceiling, there is no need to decorate under it, saving money on that too!

Stretch Fabric can be used just about anywhere, from Home Cinema to Schools. It is fast and convenient.

Product Code	Description	Retail
FSW1010YB	Fabric wall, 25mm thick, price per square metre. All pricing is approximate and for guide purposes only and are based on installation during normal working hours	1017

FABRICS

Group A	Group B	Group C
Camira Cara	Camira Lucia	Camira Nexus
