

Frequently Asked Questions – SAP Web AS 6.10 Test Suite

Installation cancelled at 28% or 85%

Check the network configuration as described in the Installation Guide; also follow the notes for installation under Windows XP.

Start the *Remote Registration Service* and *Distributed Transaction Coordinator* before installation.

Installation cancelled at 42%

Insert the second CD at 42% and press **Continue**.

Installation cancelled at 51%

The installation path – including drive name – must be 12 characters long or less (i.e. *D:\MINISAP61*).

Installation cancelled at 88%

Under Win 2000 ...**Administration | Services**, start the *Distributed Transaction Coordinator* service.

Note for Windows XP

The installation of Web AS 6.10 has been successfully tested using FAT32-formatted drives under Windows XP.

Should you encounter problems during the installation, we recommend converting the hard drive to the Microsoft-recommended NTFS format, which only takes a few minutes and which you can do at the touch of a button under Windows XP.

The full name of the directory where the SAP DB of the Web AS is installed, ...*\sapdb\WA1*, must not exceed 50 characters.

Please note that under Windows XP, the name of the directory specified during installation can be implicitly supplemented by user-specific path information.

Installation on Windows NT

Windows NT is no longer supported in Version 6.10 and later.

Error message at logon: "No Logon possible" (no hw ID received by mssg server)

The usual cause for this error is that system file ...*\system32\...\etc\services* already contains an entry for port 3600 during installation. If so, mark the entry with "#" to deactivate it.

After installation, the entry must appear as follows:

Creating a New Development Class

Transaction SE80 now has an "Edit Object" button. You can use it to create a new development class (the name must start with Y or Z).

In Version 6.10 and later, the term "development class" has been replaced with "package".

Creating Your Own Programs

Please note: the name has to start with Y or Z.

Note on Global Exception Classes

Page 343 of the book specifies the prefix for exception classes as "CX_". On the Mini Web AS, the customer namespace ZCX_ or YCX_ has to be used.

Unfortunately, the Basis version of the Mini Web AS contains an error that prevents the Class Builder from accepting these names.

myGalileo will soon offer a transport request that you can download to solve this problem. Once you install the transport, you can create global exception classes in the customer namespace.

Runtime Error under DOKTL

This error only occurs when you run the system on a PC without a network connection. To solve this problem, install the MS Loopback Adapter as described on the first CD.

Developing BSP Applications on Web AS 6.10

The start page of the first CD contains a link, "Starting Web AS 6.10 Demo – Getting started with a simple BSP (Business Server Pages) demo" It describes the initial steps.

Developer Key and License Extension

The developer key (29671482393151224771) is available under <http://www.sap.com/technology/minisap/>.

You can also retrieve the license extension key from there.
