hearTest

hearTest is an innovative mobile hearing health application, offering reliable, clinically-validated, cost-effective mobile pure tone audiometry. Automated self-test or operator modes determine hearing thresholds to determine severity and configuration of hearing loss. Conventional frequencies in test range = 125 Hz - 8 kHz. Extended high frequencies in test range = 125 Hz - 16 kHz.

hearScope

hearScope is a smartphone otoscope for accurate diagnosis of ear disease. Users are able to easily take an image or video of an eardrum using the hearScope hardware attachment. Recorded media can be cropped and saved with text or voice notes. hearScope is shipped in a handy carry case, with a phone stand and 6 reusable specula (2 x 3mm, 2 x 4mm and 2 x 5mm).

Features coming soon:

Soon the recorded media will be able to be attached to a patient record and uploaded into mHealth Studio Cloud. Our artificial intelligence system will apply machine learning to provide accurate diagnosis for the most common ear diseases.*

hearKiosk

hearKiosk is a hearing screening health application for clinically-valid, time-efficient, low-cost screening using either digits-in-noise (DIN) or pure tone audiometry (PTA). The DIN hearing screening identifies your ability to perceive sound within noise whereas the PTA version uses quick screening protocols for pure tone audiometry screening. The application's screening can be completed in under 2 minutes and gives a 'pass' or 'refer' outcome per patient.
