

Press release

Our Blockchain is already fully operational!

Paris, 13 July 2018 - After a test phase of only 6 weeks, WPO has reached the required technical maturity to blockchain green energy production. Five wind turbines spread over three sites in France have had their production certified by our blockchain, and we've just issued our 11,000th production certificate (GoCert). This represents the equivalent of 11GWh certified, which is the average annual consumption of over 2,300 French households.

This is a world first, and our teams are proud to have accomplished this huge challenge! We will now deploy our blockchain in new wind and solar farms in France and abroad (Europe and China).

GoCerts allow for the irrefutable identification of each MWh produced under the supervision of WPO, ensuring its green origin. The "*certified data lake*" ensures optimal assets management thanks to the many variables it brings into light.

GoCert buyers will bring a positive contribution to the development of renewable energy production as part of their CSR policy. In the future, GoCerts will also be used as proof of purchase for other WPO certified goods and services, green electricity trading through smart contracts, etc.
