

Pentana Audit v6.0.1.4: Technical Update

Contents

About This Document	2
Changes	2

About This Document

This is an overview of the technical aspects of the release that require new or changed configuration, and is intended for use by those with previous experience of installing Ideagen Pentana Audit and Retain.

Changes

New system requirement: .NET v4.8

This patch to Pentana Audit contains no functional enhancements or bug fixes.

The purpose of the release is to update the minimum version requirement for the .NET Framework to v4.8, due to our earlier supported versions now being end of life and no longer supported by Microsoft.

If upgrading to Pentana Audit v6.0.1.4 it is essential that the server and client PC's are all running .NET v4.8.

If an earlier version of .NET is used:

- The Service and Webservice will spin up, but may error during normal use
- The Robot will fail to start
- The client will not start

To check your installed version of .NET, refer to our KB article [Pentana Audit: Which version of .NET is installed on this PC or Server? – Pentana Audit \(ideagen.com\)](#).
