About Kinesense

Kinesense develops tools that help the security and surveillance market manage digital evidence quickly, easily, and securely.

The global growth in CCTV surveillance means video evidence is increasingly important in investigating crimes and prosecuting criminals. But this growth also brings an increased strain on investigators' resources. **Kinesense** makes products that reduce the time and effort it takes to retrieve, view, analyze and report on this evidence.

All **Kinesense** products are based on our own video analytics methodology, which eliminates much of the time normally spent sifting through video to look for key events. We develop each product to meet needs identified by

our customers, so that every tool in our **Kinesense** range solves real problems.

Kinesense video analysis software detects events automatically. It enables investigators to save up to 95% of time on investigations involving CCTV footage, reducing costs and freeing up staff resources. Our products can be used by individual teams or deployed across your organization.

Our technology is based on years of research, testing and deployment. It is currently used by the security and surveillance industry, including technical support, major investigation, counterterrorism and serious crimes units, as well as overt and covert surveillance teams.

Key Benefits

- Creates actionable intelligence, fast
- Saves up to 95% of time
- Enables secure chain of evidence
- Easy to use
