TECH TIPS

To help our customers, we've captured the most common questions asked about our products. We're also creating a series of Dr. Ehrenstorfer Tech Tips videos and PDFs to help you.

Our most frequently asked questions include:

1 How much material is in the bottle/ampoule?

Dr. Ehrenstorfer neat reference materials are supplied with a nominal weight, and the vial or bottle is typically overfilled with 10% more of the product than stated. However, this means the exact amount of material supplied cannot be provided. In order to use the material, it is usually practical to prepare a solution.

The preparation procedure described below can be used to calculate the amount of material present.

2 The container looks empty – is there anything inside?

Where small quantities of solid material are supplied, this can be dispersed over the inside surface of the container. Liquid may also coat the inner surface of the container which may not be visible. Therefore, please refer to the following procedure to extract the material from the container.

3 How can I prepare a solution from neat Dr. Ehrenstorfer product?

In order to recover all the material from the container the following procedure can be used. We recommend storing the vial / bottle in an upright position for at least 24 hours prior to handling.

1. Ensure the container is clean and dry. Using an analytical balance, weigh the container (including the lid for bottles) and record the weight.
2. Using a suitable solvent, carefully transfer the contents to a volumetric flask. Rinse the container (including the lid) at least three times and combine all rinses to ensure a complete transfer of material.
3. Dry the empty container completely, then using an analytical balance, weigh the dry, empty container and lid and record the weight.
4. Calculate the difference in weight between the first and second weighing. The difference in weight is the amount of material that has been transferred.
5. Make the solution up to volume in the volumetric flask. The concentration of the solution can then be determined.

Where larger quantities of material are supplied, you may wish to only transfer an aliquot of the material. In these cases, you may need to use a weighing boat and a spatula to weigh the material before transferring it into the volumetric flask.

QUALITY AND ACCREDITATION

1 Certification

Dr. Ehrenstorfer use a quality management system certified to ISO 9001 and methodology accredited to ISO/IEC 17025 to manufacture products. Traceability back to the SI unit is demonstrated by using accredited procedures measuring weight, volume and temperature.

2 Gravimetric certification

Dr. Ehrenstorfer solution standards are designed for calibration or recalibration of chromatographic or other analytical systems used for quantitative or qualitative purposes. The products may also be used as reference standards for interlaboratory studies and to validate analytical procedures.

All raw materials used to prepare the multicomponent mixtures are of the highest purity. After our production process, each material is checked using several of the following methods, if applicable: UV, IR spectroscopy, elemental analysis, chromatographic properties (GC/FID, GC/ECD, HPLC/DAD, TLC) and physical properties (phase, colour, odour, melting point) and Karl Fischer titration for detection of water content.

3 Measurement uncertainty

In accordance with the Guide to the Expression of Uncertainty in Measurement (GUM), our Certificates of Analysis list the expanded concentration uncertainty at the 95% confidence level, using a coverage factor of k = 2. The expanded uncertainty is based on the combination of uncertainties associated with the individual steps involved in the preparation of the product e.g. purity, material density and weighing technique.

4 ISO 17034 / ISO Guide 34

A range of materials are produced under Dr. Ehrenstorfer's **ISO 17034 / ISO Guide 34** scope of accreditation. These materials are identified in this catalogue by the symbol ‡. This range is constantly increasing, therefore if you are unable to find the product that you require, please contact your local sales office or email us at **dr.ehrenstorfer@lgcgroup.com**.

The main difference between products produced under **ISO 17034 / ISO Guide 34** scope of accreditation and other products, is that the homogeneity testing and the calculation of the measurement uncertainties are performed strictly according to **ISO 17034 / ISO Guide 34** and **ISO Guide 35**. These products are provided with a Certificate of Analysis, which fulfills the requirements of **ISO 17034 / ISO Guide 34** and **ISO Guide 31**.

5 Expiry dates

All materials are supplied with an assigned expiry date which is printed either on the certificate of analysis or the product label.

6 Storage and transportation

Every reference material is stored under controlled conditions as stated on the certificate. These conditions are for the long term storage of the material. Normally products are not shipped under controlled conditions as shipping times are generally <72 hours and therefore short term. One sample of each lot is kept aside to enable checks on the specific lot to be undertaken if required.

HOW TO READ YOUR CERTIFICATE OF ANALYSIS

Dr. Ehrenstorfer Certificates of Analysis provide a full description of the material to which they relate and summarise the analyses undertaken during the characterisation process. Current Certificates of Analysis for individual lots of products in the range are available on our website, lgcstandards.com on the relevant product pages. If you are unable to find the product that you require please contact one of our local sales offices.

An example of a Certificate of Analysis for a neat product is given below. For certificates of gravimetric solutions, the following information is included:

- **Gravimetric data**
  Concentration of the product, purity and the weight of product.
- **Solvent information**
  Identity, lot number and exact quantity of solvent used.
- **Traceability data**
  Identification of materials used including lot numbers for any neat and solution products used.

Article/Product Code
The unique identification code for the product is given in the certificate.

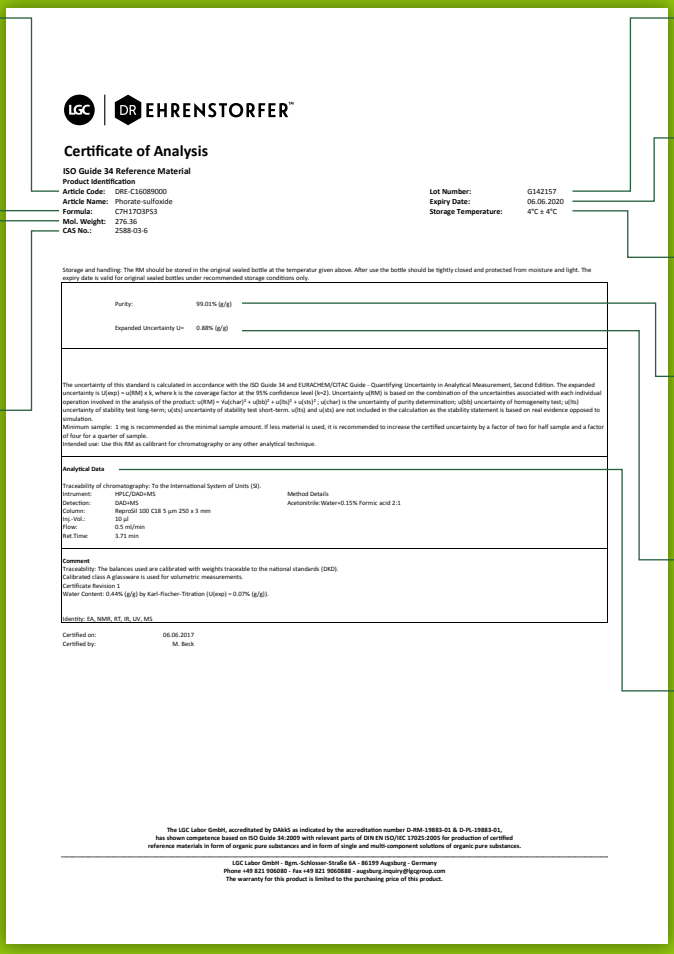

Formula
Molecular formula of the material.

Mol. weight
Molecular weight of the material.

CAS No.
A unique identifier assigned by the Chemical Abstracts Service.

Note 1
Storage conditions
These are the minimum storage requirements based on stability studies.

Note 2
Tolerance / Uncertainty
For products produced under ISO 17034/ISO Guide 34 scope of accreditation the uncertainty is calculated in accordance with ISO 17034/ISO Guide 34 and RUECHEM/ CITAC Guide - Quantifying Uncertainty in Analytical Measurement, Second Edition.

Purity: 99.01% (g/g)

Expanded Uncertainty U= 0.88% (g/g)

The uncertainty of this standard is calculated in accordance with the ISO Guide 34 and EURACHEM/CITAC Guide - Quantifying Uncertainty in Analytical Measurement, Second Edition. The expanded uncertainty is U(exp) = u(RM) x k, where k is the coverage factor at the 95% confidence level (k=2). Uncertainty u(RM) is based on the combination of the uncertainties associated with each individual operation involved in the analysis of the product: $u(RM) = \sqrt{u(char)^2 + u(bb)^2 + u(lts)^2 + u(sts)^2}$; u(char) is the uncertainty of purity determination; u(bb) uncertainty of homogeneity test; u(lts) uncertainty of stability test long-term; u(sts) uncertainty of stability test short-term. u(lts) and u(sts) are not included in the calculation as the stability statement is based on real evidence opposed to simulation.
Minimum sample: 1 mg is recommended as the minimal sample amount. If less material is used, it is recommended to increase the certified uncertainty by a factor of two for half sample and a factor of four for a quarter of sample.
Intended use: Use this RM as calibrant for chromatography or any other analytical technique.
