

$$2 + 10 - 3 =$$

$$27 \div 3 \times 5 =$$

$$6 + 3 \times 5$$

$$9 - 16 \div 4$$

$$81 \div 9 + 6 \times 7$$

$$4 \times 8 - 33 \div 3$$

$$20 - 3 + 7 - 2$$

$$8 \div 4 \times 10 \div 5$$

$$15 \div 3 + 6 - 2$$

$$16 + 9 - 4 \times 8$$

$$5 + 3 \times 9 - 1$$

Write the missing number.

$$6 + 2 \times 2 - \square = 6$$

1. Always, Sometimes, Never?

Addition comes before subtraction when calculating.

2. Convince me that $3 + 5 \times 2$ can be done in two orders and give different answers.
