1. General Experimental Information

All manipulations were performed in oven-dried glassware in an atmosphere of air unless stated. Ag_2CO_3 and AgOPiv were prepared according to literature procedures.^{S1,S2} All other reagents and solvents were purchased from either Alfa Aesar, Fisher Scientific or Sigma Aldrich and used as supplied. Flash column chromatography was performed on silica gel (Fluorochem, silica gel 60 Å, particle size 40-63 µm). Thin layer chromatography was performed on glass-backed silica gel plates (2.5 x 7.5 cm; Merck, TLC silica gel 60 Å); compounds were visualised by exposure to UV light (254 nm) or using a permanganate stain. NMR spectra were recorded on a JEOL Eclipse 400 spectrometer at 298 K; chemical shifts are reported in parts per million and coupling constants are reported in Hz. For some compounds, assignments for ^1H and ^{13}C NMR peaks were aided by ^1H - ^1H COSY, ^1H - ^1H NOESY and ^1H - ^{13}C HMQC 2D NMR experiments. FTIR spectra were recorded in a diamond ATR cell using Perkin-Elmer Spectrum 2 instrument or an Agilent Technologies Cary 630 instrument. Melting points were recorded on a Stuart SMP10 melting point apparatus and are uncorrected. High-resolution mass spectrometry was obtained from the EPSRC UK National Mass Spectrometry Facility at Swansea University on an LTQ Orbitrap XL 1, using positive electrospray ionisation (ESI+). HPLC was performed on a Waters Acquity UPLC instrument, in conjunction with a Waters Xevo-G2XS-QTOF for MS analysis, using a Restek Raptor C18 2.7 µm column with a gradient eluant from 0.1 % formic acid / 10% MeOH / H_2O to 0.1 % formic acid / MeOH over 10 minutes at a flow rate of 0.25 mL/min.

2.1. Synthesis of protected amino acids

N-Phthaloyl glycine (Phth-Gly-OH)

Phthalic anhydride (2.000 g, 13.50 mmol) and glycine (0.780 g, 10.39 mmol) were slurried in toluene before the addition of triethylamine (1.88 mL, 13.50 mmol). The resulting suspension was refluxed under Dean-Stark conditions for 10 h. After allowing the mixture to cool to room temperature, the toluene was removed by rotary evaporation to give a crude oil. The oil was suspended in water and acidified using conc. HCl(aq.) (3 mL) to give a white solid that was isolated by filtration and dried on the filter pad to afford off-white needles of Phth-Gly-OH (2.005 g, 94%), m.p. 190-192 °C.

***N*-methyl-L-phenylalanine methyl ester hydrochloride (Me-Phe-OMe.HCl)**

Under an atmosphere of dry nitrogen, LiOH.H₂O (0.418 g, 9.967 mmol) and 4 Å molecular sieves were stirred in anhydrous DMF (15 mL) for 20 min. L-phenylalanine methyl ester hydrochloride (1.000 g, 4.636 mmol) was added to the solution and stirred for a further 45 min before the addition of iodomethane (0.317 mL, 5.100 mmol). The resulting suspension was left to stir at room temperature for 18 h. The brown suspension was then filtered and the filter cake washed with EtOAc (50 mL). The filtrate was then washed with water (3 x 30 mL), dried (MgSO₄) and concentrated to dryness *in vacuo*. to give a yellow oil. The oil was purified by flash column chromatography using EtOAc as eluent to give Me-Phe-OMe.HCl as a pale-yellow oil (0.682 g, 64%), R_f 0.33 (EtOAc).

2.2. Synthesis of Gly-Phe dipeptides 1a-1e

2.2.1. General procedure for the preparation of dipeptides

The L-(amino acid) methyl ester hydrochloride (2.50 mmol) and K₂CO₃ (0.498 g, 3.60 mmol) were dissolved in distilled water (30 mL) and stirred for 10 min at room temperature. The free amine was extracted with Et₂O (3 x 20 mL), dried (MgSO₄) and concentrated by rotary evaporation. The resulting colourless oil was dissolved in CH₂Cl₂ (20 mL); the *N*-protected amino acid (1.00 mmol), HBTU (0.379 g, 1.00 mmol) and DIPEA (0.174 mL, 1.00 mmol) were then added to the reaction mixture, which was stirred for 12 h. The resulting suspension was filtered and washed with 1 M HCl (20 mL), sat. NaHCO₃ (3 x 20 mL) and H₂O (20 mL). The organic layers were then dried (MgSO₄) and concentrated to dryness *in vacuo*. The resulting oil was recrystallised from CH₂Cl₂ / hexanes.

Ac-Gly-Phe-OMe (**1a**)

Peptide **1a** was synthesised from L-phenylalanine methyl ester hydrochloride (0.539 g, 2.50 mmol) and *N*-acetylglycine (0.117 g, 1.00 mmol), using the procedure in **section 2.2.1**. The crude compound was recrystallised from CH₂Cl₂ / hexanes to afford **1a** as a white solid (0.218 g, 78%); m.p. 95-97 °C.

2.3. Optimisation of the C-H olefination

Peptide **1a** (0.100 g, 0.359 mmol), Pd(OAc)₂ (8.0 mg, 0.036 mmol, 10 mol%), oxidant (2.5-5.0 eq.) and styrene (1.0-10.0 eq.) were stirred together in solvent (3 mL) at 130 °C for 12 h. The reaction was then allowed to cool to room temperature, filtered through a plug of Celite, and the filtrate was concentrated to dryness. The resulting residue was purified by flash column chromatography (EtOAc) and recrystallised from CH₂Cl₂ / hexanes.

2.3.1. General procedure for the olefination of phenylalanine containing peptides

The peptide (0.359 mmol), Pd(OAc)₂ (8 mg, 0.036 mmol, 10 mol%), AgOAc (0.300 g, 1.780 mmol) and styrene (0.166 mL, 1.440 mmol) were stirred in *t*-amyl-OH (3 mL) at 130 °C for 12 h. The reaction mixture was then allowed to cool to room temperature and filtered through a plug of Celite. The filtrate was then concentrated to dryness. The resulting residue was purified by flash column chromatography and recrystallised from CH₂Cl₂ / hexanes.

C-H olefination of model dipeptide **1a**; synthesis of modified peptides **2a** and **2a'**

Following the general procedure in **section 2.3.1**, the reaction of Ac-Gly-Phe-OMe (**1a**) (0.100 g, 0.359 mmol), styrene (0.166 mL, 1.440 mmol), $\text{Pd}(\text{OAc})_2$ (8 mg, 0.036 mmol, 10 mol%) and AgOAc gave a crude product that was a mixture of the di-olefinated peptide **2a** and the mono-olefinated peptide **2a'** in a ratio of 8:1, as judged by ^1H NMR spectroscopy. 2.4. Detailed synthetic method at 1 mmol scale

The peptide Ac-Gly-Phe-OMe (**1a**) (0.278 g, 1.0 mmol), $\text{Pd}(\text{OAc})_2$ (22 mg, 0.1 mmol, 10 mol%), AgOAc (0.835 g, 5.0 mmol) and styrene (0.46 mL, 4.0 mmol) were stirred in *t*-amyl-OH (8.5 mL), in a microwave vial, at 130 °C for 36 h. The reaction mixture was then allowed to cool to room temperature and filtered through a plug of Celite. The filtrate was then concentrated to dryness. The resulting residue was purified by flash column chromatography (EtOAc) and recrystallised from CH_2Cl_2 / hexanes to give **2a** as an off-white solid (0.338 g, 70%). The data for **2a** was in agreement with that reported above.

2.9. Synthesis of tri- and tetra-peptides

2.9.1. General procedure for the synthesis of tripeptides

Sodium carbonate (0.206 g, 1.940 mmol) was dissolved in H₂O (15 mL) and added to a solution of the appropriate dipeptide ester (0.970 mmol) in MeOH (15 mL). The resulting suspension was stirred at room temperature for 4 h before acidification by the dropwise addition of 1 M HCl (~3 mL). The aqueous solvent was then removed and the resulting solid washed with ethanol (3 x 10 mL), before the filtrate was evaporated to dryness. The crude dipeptide acid was then used without further purification. L-(amino acid) methyl ester hydrochloride (2.280 mmol) and K₂CO₃ (0.454 g, 3.283 mmol) were dissolved in distilled water (30 mL) and stirred for 10 min at room temperature. The free amine was extracted with Et₂O (3 x 20 mL), dried (MgSO₄) and concentrated to dryness. The resulting residue was slurried in CH₂Cl₂ (20 mL) before the N-protected dipeptide (0.912 mmol), HBTU (0.346 g, 0.912 mmol) and DIPEA (0.158 mL, 0.912 mmol) were added. The suspension was then stirred for 16 h at room temperature. The suspension was then filtered and washed with 1M HCl (20 mL), sat. NaHCO₃ (3 x 20 mL) and water (20 mL). The organic layers were then dried (MgSO₄) and concentration to dryness *in vacuo*. The resulting residue was purified by column chromatography using EtOAc as eluent, before being recrystallised using CH₂Cl₂ / hexanes.

2.9.2. General procedure for the synthesis of tetrapeptides

Sodium carbonate (0.068 g, 0.646 mmol) was dissolved in H₂O (10 mL) and added to a solution of the appropriate tripeptide ester (0.323 mmol) in MeOH (10 mL). The resulting suspension was stirred at room temperature for 4 h before acidification by the dropwise addition of 1 M HCl (~3 mL). The aqueous solvent was then removed and the resulting solid washed with ethanol (3 x 10 mL), before the filtrate was evaporated to dryness. The crude tripeptide acid was carried through without further purification. The appropriate L-(amino acid) methyl ester hydrochloride (0.808 mmol) and K₂CO₃ (0.161 g, 1.162 mmol) were dissolved in distilled water (30 mL) and stirred for 10 mins at room temperature. The free amine was extracted with Et₂O (3 x 20 mL), dried (MgSO₄) and concentrated to dryness. The resulting residue was slurried in CH₂Cl₂ (20 mL), before N-protected dipeptide (0.323 mmol), HBTU (0.122 g, 0.323 mmol) and DIPEA (0.056 mL, 0.323 mmol) were added. The suspension was then stirred for 16 h at room temperature. The suspension was then filtered and washed with 1M HCl (20 mL), sat. NaHCO₃ (3 x 20 mL) and water (20 mL). The organic layers were then dried (MgSO₄) and concentrated to dryness *in vacuo*. The resulting residue was purified by column chromatography using EtOAc as eluent, before being recrystallised using CH₂Cl₂ / hexanes.

Peptide **6c** was subjected to the general procedure described in **section 2.3.1**. After 12 h, analysis of the crude reaction mixture by ¹H NMR spectroscopy showed a mixture of unreacted peptide **6c** and styrene only. There was no evidence for modification of the peptide.

Synthesis of modified peptide **9a**

Modified peptide **9a** was prepared from Ac-Gly-Phe-Leu-Leu-OMe (**7a**) (0.060 g, 0.119 mmol) and styrene (0.055 mL, 0.476 mmol), using the general procedure in **section 2.3.1**. The ^1H NMR spectrum for the crude product contained a mixture of the di-olefinated peptide **9a** and the mono-olefinated peptide in a ratio of 5:1. Purification by flash column chromatography (10% MeOH/ CH_2Cl_2) followed by recrystallisation from CH_2Cl_2 / hexanes gave **9a** as an off-white solid (0.025 g, 30%); m.p. 206-209 °C, R_f 0.15 (10% MeOH/ CH_2Cl_2)

2.11. Investigation of potential racemization in the C-H olefination reaction

For the synthesis of modified peptides that contained more than one stereogenic centre, there was no evidence for the formation of diastereomeric products, as judged by NMR spectroscopy.

In addition, a detailed stereochemical investigation was carried out for the reaction of peptide Ac-Ala-Phe-OMe (**4a**) to give modified peptide **5a**. Specifically, the diastereomeric peptide Ac-Ala-D-Phe-OMe, (L,D)-**4a**, prepared from D-phenylalanine methyl ester and acetyl-L-alanine, was modified to give the diastereomeric modified peptide (L,D)-**5a**.

Comparison of the ^1H NMR spectra revealed no signals for (L,D)-**5a** in the spectrum for **5a**. Comparison of the HPLC chromatograms revealed that **5a** contained at very most, less than 2.5% (L,D)-**5a**. The small amount of the L,L contaminant **5a** in the reference sample (L,D)-**5a** arises from the enantiomeric impurity in the starting D-phenylalanine.

The relevant synthetic procedures, characterisation data, and comparison of NMR spectra and HPLC chromatograms are presented below.

Ac-Ala-D-Phe-OMe, (L,D)-**4a**

Peptide (L,D)-**4a** was synthesised from D-phenylalanine methyl ester hydrochloride (0.539 g, 2.50 mmol) and *N*-acetyl-L-alanine (0.131 g, 1.00 mmol), using the procedure in **section 2.2.1**. The crude product was recrystallised from CH_2Cl_2 / hexanes to afford (L,D)-**4a** as a white solid (0.251 g, 86%); m.p. 125-128 °C.

CC(=O)N[C@H](Cc1ccccc1)C(=O)N[C@@H](Cc2ccccc2)C(=O)OC

¹H NMR spectrum (400 MHz, CDCl₃) of N-benzyl-L-phenylalanyl-L-phenylglycine methyl ester. The spectrum shows peaks from 0.00 to 7.23 ppm. Integration values are provided below the baseline: 9.31, 2.06, 0.95, 0.94, 2.00, 3.10, 4.27, 3.04. A reference peak is at 0.00 ppm.
