1. General Information

Unless otherwise noted, all reagents were purchased from commercial suppliers and used without further purification. ^1H NMR and ^{13}C NMR spectra were recorded at 25 °C on a Bruker Advance 400M NMR spectrometers (CDCl_3 as solvent). Chemical shifts for ^1H NMR spectra are reported as δ in units of parts per million (ppm) downfield from SiMe_4 (δ 0.00) and relative to the signal of SiMe_4 (δ 0.00 singlet). Multiplicities were given as: s (singlet); d (doublet); t (triplet); q (quartet); dd (doublet of doublets); dt (doublet of triplets); m (multiplets), etc. Coupling constants are reported as a J value in Hz. ^{13}C NMR spectra are reported as δ in units of parts per million (ppm) downfield from SiMe_4 (δ 0.00) and relative to the signal of chloroform- d (δ 77.16 triplet). Infrared spectra (IR) were recorded using a thin film on a Nicolet 6700 ATR/FT-ATR spectrometer, and ν_{max} are partially reported in cm^{-1} . High resolution mass spectral analysis (HRMS) was performed on Waters XEVO G2 Q-TOF using ESI-QTOF. The enantiomeric excesses were determined by HPLC analysis on Chiral Daicel Chiralpak OD-3 and OB-H columns. Flash chromatography was performed using 200-300 mesh silica gel with the indicated solvent system. Gas chromatography was performed with machines of Agilent Technologies 7890A. Optical rotations were recorded on an Anton Paar MCP 200 polarimeter at 589 nm in CHCl_3 .

2. Experimental Procedures

2.1 Synthesis of Starting Materials

Method A:

The starting materials **1a**-(A-N) and **1b**, were prepared according to the literature procedure¹ with slight modifications.

A mixture of 2-methylallylamine **S1** (0.78g, 10 mmol), acid (11 mmol), *N*-(3-dimethylaminopropyl)-*N'*-ethylcarbodiimide hydrochloride (EDCI) (2.11 g, 11 mmol), 1-hydroxybenzotriazole (HOBt) (1.49 g, 11 mmol), and DIPEA (3.3 mL, 20 mmol) in DCM (30 mL) was stirred at room temperature overnight. Water was added and the mixture was extracted with DCM. The combined organic layers were washed with water and brine, dried over anhydrous Na₂SO₄, filtered and concentrated *in vacuo*. The resulting residue was purified by silica gel flash chromatography (hexanes/ethyl acetate) to give the desired product.

Method B:

The starting materials [**D2**]-**1a**, **1c**, **1i** and **1n** were prepared according to the literature procedure^{1,2} with slight modifications. The starting material [**D2**]-**1a** was prepared from [**D2**]-*N*-(2-methylallyl)-phthalimide which was prepared according to the literature procedure³.

To a mixture of triphenylphosphine (25mmol), phthalimide (25 mmol) and the corresponding allyl alcohol (25mmol) in THF (30 mL) was slowly added diethyl azodicarboxylate (DEAD) (25mmol) at 0 °C under N₂ atmosphere. The mixture was stirred at 0 °C for 3 h. After the completion of the reaction, the reaction mixture was diluted with hexane and filtered. The filtrate was dried over Na₂SO₄ and concentrated *in vacuo* to give the crude product, which was used without further purification.

To the solution of phthalimide product in ethanol (100 mL) was added hydrazine monohydrate (50 mmol) at 50 °C. The mixture was stirred for 1 h and quenched with hydrochloric acid (6.0 M, 20 mL). The precipitates formed were removed by filtration, and the resultant filtrate was dried over Na₂SO₄ and concentrated *in vacuo* to give an unsaturated amine hydrochloride. Aqueous NaOH (6.0 M, 10 mL) was added to the amine salt, and the resulting solution was extracted with DCM (25 mL ×3). The combined organic extracts were then washed again with brine (10 mL), dried over Na₂SO₄, and filtered. The amine solution was used without further purification.

To the solution of amine (10 mmol) was successively added isoquinoline-1-carboxylic acid (11 mmol), EDCI (2.11 g, 11 mmol), HOBt (1.49 g, 11 mmol), and DIPEA (3.3 mL, 20 mmol). The resultant mixture was stirred at room temperature overnight. Water was added and the mixture was extracted with DCM. The combined organic layers were washed with water and brine, dried over anhydrous Na₂SO₄, filtered and concentrated *in vacuo*. The resulting residue was purified by silica gel flash chromatography (hexanes/ethyl acetate) to give the desired product.

Method C:

The starting materials **1d-h** and **1j-m** were prepared according to the literature procedure^{1,4} with slight modifications.

Stage 1:

To the stirred solution of **S3** (10 mmol) in DCM (30 mL) were added EDCI (2.11 g, 11 mmol) and HOBt (1.49 g, 11 mmol), and the mixture was stirred for 30 min. *N,O*-dimethylhydroxylamine·HCl (1.07 g, 11 mmol) was added to the reaction mixture followed by DIPEA (2.58g, 3.3 mL, 20 mmol), and the mixture was stirred for another 14 h at rt. The reaction mixture was diluted with H₂O (20 mL), extracted with DCM (2

× 20 mL). The combined organic layers were washed successively with 1 N HCl (10 mL), H₂O (10 mL), and brine (10 mL), dried over Na₂SO₄, filtered and concentrated to afford the desired product as an off white powder.

Stage 2:

S4 (10 mmol, 1.0 equiv.) obtained from stage 1 was added to a 250 mL RBF followed by THF (50 mL) as the solvent. The mixture was cooled to 0 °C and a corresponding Grignard reagent in THF (30.0 mmol, 3.0 equiv.) was added over 8 min. The reaction mixture was stirred for 1.0 h at 0 °C and for an additional 1.0 h at rt. Subsequently, the reaction was again cooled to 0 °C and quenched by slow addition of 1.0 M HCl (50 mL). The mixture was transferred to a separatory funnel with additional 1.0 M HCl (50 mL) and extracted with EtOAc (3 × 40 mL). The organic phases were combined, washed with water, brine and dried over MgSO₄, filtered and the solvent was removed *in vacuo*. The resulting residue was purified by silica gel flash chromatography (hexanes/ethyl acetate) to give the desired product **S5**.

Stage 3:

To a suspension of Ph₃PCH₃Br (22 mmol) in toluene (40 mL), was slowly added a solution of NaHMDS in THF (1 M, 21 mL) at 0 °C and the resulting yellow solution was stirred for 15 min at 0 °C. Then a solution of the ketone **S5** (10 mmol) in toluene (10 mL) was added dropwise at 0 °C and continued stirring for 2 h at rt. Water (50 mL) was added and the aqueous layer was extracted with Et₂O (3 × 20 mL). The organic phases were combined, washed with water, brine and dried over MgSO₄, filtered and the solvent was removed *in vacuo*. The resulting residue was purified by silica gel flash chromatography (hexanes/ethyl acetate) to give the desired product *N*-Boc protected allylamine **S6**.

Stage 4:

To a solution of *N*-Boc protected allylamine **S6** (10 mmol) in anhydrous DCM (15 mL) at 0 °C, trifluoroacetic acid (15 mL, 19 mmol) was added slowly with stirring at 0 °C. After the starting material had been consumed, the reaction mixture was concentrated *in vacuo*. Aqueous NaOH (2.0 M, 50 mL) was added to the residue, and the resulting solution was extracted with DCM (30 mL ×2). The combined organic extracts were then washed with brine solution (10 mL), dried over Na₂SO₄, filtered.

The amine solution was used without further purification.

To the solution of amine (10 mmol) was successively added isoquinoline-1-carboxylic acid (11 mmol), EDCI (2.11 g, 11 mmol), HOBt (1.49 g, 11 mmol), and DIPEA (3.3 mL, 20 mmol). The resultant mixture was stirred at room temperature overnight. Water was added and the mixture was extracted with DCM. The combined organic layers were washed with water and brine, dried over anhydrous Na₂SO₄, filtered and concentrated *in vacuo*. The resulting residue was purified by silica gel flash chromatography (hexanes/ethyl acetate) to give the desired product.

The mixture was first stirred at 25 °C for 5 min and then heated to 130 °C for 22 h under vigorous stirring. Then the mixture was cooled to room temperature, diluted with EtOAc, filtered through a celite pad, and concentrated *in vacuo*. The resulting residue was purified by silica gel flash chromatography (hexanes/ethyl acetate) to give the desired product **3** or **4**.

2.4 Large Scale Reaction of 1a and 2a

A 35 mL sealed tube was charged with **1a** (452.6 mg, 2.0 mmol), **2a** (1.47 g, 8 mmol), Pd(OAc)₂ (44.9 mg, 0.2 mmol), TEMPO (93.8 mg, 0.6 mmol), K₂CO₃ (552.8 mg, 4.0 mmol) and 18-crown-6 (26.4 mg, 5 mol %, in 5.0 mL ^tAmylOH). The solution of compound **4u** (40.0 mg, 0.11 mmol, 20% ee) in MeOH (1.0 mL) and DCM (1.0 mL) was saturated with ozone at -78 °C until a persistent blue color was observed.
