## INDEX:

**Table S1:** Overview of state of the art for CO<sub>2</sub> conversion via bifunctional catalyst.

**Table S2:** Unit cell parameters of ZSM-5 and MOR.

**Table S3:** Surface area (BET) and elemental composition of the ZSM-5 and MOR zeolites.

**Table S4:** Detailed catalytic performance of the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub> material at 30 bar, H<sub>2</sub>/ CO<sub>2</sub>=3, and 10000 mL·g<sup>-1</sup>·h<sup>-1</sup>.

**Table S5:** Reproducibility of the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/MOR and Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/ZSM-5 bifunctional systems.

**Figure S1.** Straight channel view of the of ZSM-5 and MOR zeolite framework with indication of the possible acid sites. The unit cell size is marked by the dotted line.

**Figure S2.** Collective variable (CV) used in the 1D umbrella sampling for alkene protonation.

**Figure S3.** HAADF-STEM of the carbonaceous matrix in the spent Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub> catalyst.

**Figure S4.** Ammonia temperature programmed desorption (TPD) profiles of the ZSM-5 and MOR.

**Figure S5.** Stability of the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub> catalyst during 100h TOS. Reaction conditions: 375 °C, 30 bar, H<sub>2</sub>/ CO<sub>2</sub>=3, and 10000 mL·g<sup>-1</sup>·h<sup>-1</sup>.

**Figure S6.** Aromatic distribution of the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/ZSM-5 bifunctional catalyst.

**Figure S7.** Effect of the spatial arrangement on the product distribution for the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/ZSM-5 and Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/MOR bifunctional catalysts.

**Figure S8.** Effect of the reaction conditions on the aromatics selectivity and CO<sub>2</sub> conversion for the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/ZSM-5 bifunctional catalyst.

**Figure S9.** Effect of the reaction conditions on the light olefins selectivity and CO<sub>2</sub> conversion for the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/MOR bifunctional catalyst.

**Figure S10.** 1D  $^1\text{H}$ - $^{13}\text{C}$  cross-polarization MAS solid-state NMR spectra of zeolite trapped products, i.e. ZSM-5 and MOR.

**Figure S11.** Thermo-gravimetric analysis of the spent ZSM-5 and MOR zeolites.

**Figure S12.** 2D MAS  $^{13}\text{C}$ - $^{13}\text{C}$  solid-state NMR correlations identified zeolite ZSM-5 trapped molecular scaffolds.

**Figure S13.**  $^{39}\text{K}$  solid-state NMR spectra at 21.1 T and 298 K of (a) post-reacted ZSM-5 and MOR samples.

**Figure S14.** Four adsorption states of 1-nonene.

**Figure S15.** Adsorption enthalpy at 350°C for 1-, 2-, 3-, 4-nonene and 2-nonyl carbenium ion in H-ZSM-5, H-MOR-1 and H-MOR-2.

**Figure S16.** Static geometries of adsorbed 1-nonene and 4-nonene  $\pi$ -complex in H-MFI, H-MOR-1 and right H-MOR-2.

**Figure S17.** Scatter plot of the mobility of 1-nonene and 4-nonene in the channel system of H-ZSM-5 during the 100 ps MD simulation at 350°C.

**Figure S18.** Scatter plot of the mobility of 1-nonene in H-MOR-1, 1-nonene in H-MOR-2, 4-nonene in H-MOR-1 and 4-nonene in H-MOR-2 in the channel system of MOR during the 100 ps MD simulation at 350°C.

**Figure S19.** Free energy profiles for the protonation of 1-nonene into a nonyl carbenium ion in H-ZSM-5 and H-MOR-1 at 350°C.

**Figure S20.**  $\text{C}_2$ – $\text{C}_4$  olefin STY ( $\text{mmol}\cdot\text{gcat}^{-1}\cdot\text{h}^{-1}$ ) obtained in this work for the  $\text{Fe}_2\text{O}_3@/\text{KO}_2/\text{MOR}$  catalyst compared to the best bifunctional catalysts available for  $\text{CO}_2$  hydrogenation.

**Figure S21.** Aromatics STY ( $\text{mmol}\cdot\text{gcat}^{-1}\cdot\text{h}^{-1}$ ) obtained in this work for the  $\text{Fe}_2\text{O}_3@/\text{KO}_2/\text{ZSM-5}$  catalyst compared to the best bifunctional catalysts available for  $\text{CO}_2$  hydrogenation.

**Table S1.** Comparison of the state of the art bifunctional catalyst for the CO<sub>2</sub> hydrogenation towards olefin and/or aromatics.

**Figure S1.** Straight channel view of the of ZSM-5 and MOR zeolite framework with indication of the possible acid sites. The unit cell size is marked by the dotted line.

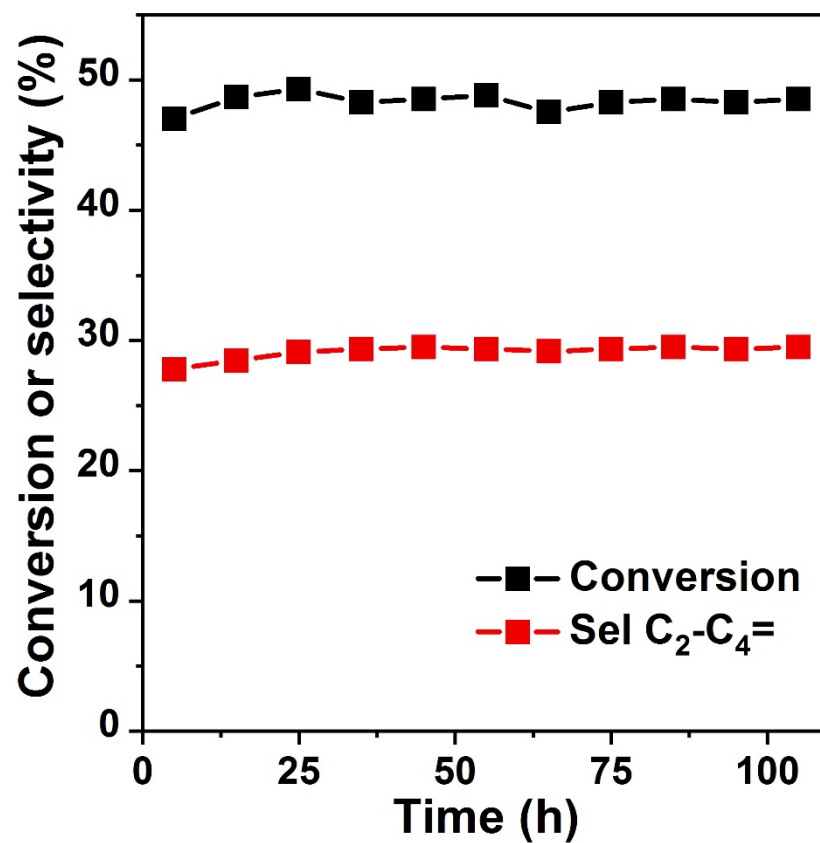

**Figure S2.** Collective variable (CV) used in the 1D umbrella sampling for alkene protonation.

**Figure S3.** HAADF-STEM of the carbonaceous matrix in the spent  $\text{Fe}_2\text{O}_3@\text{KO}_2$  catalyst.

**Figure S4.** Ammonia temperature programmed desorption (TPD) profiles of the ZSM-5 and MOR zeolites.

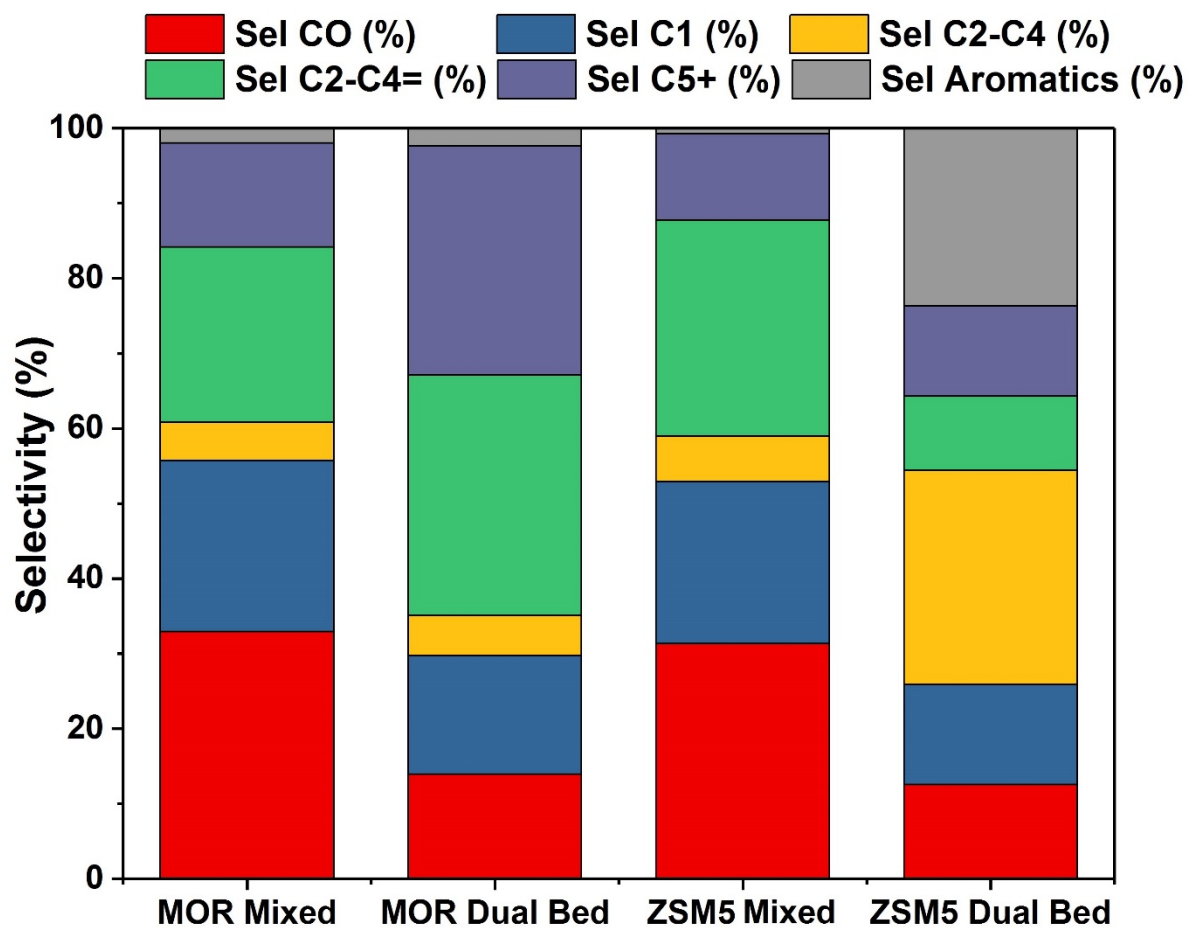

**Figure S5.** Stability of the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub> catalyst during 100h TOS. Reaction conditions: 375 °C, 30 bar, H<sub>2</sub>/ CO<sub>2</sub>=3, and 10000 mL·g<sup>-1</sup>·h<sup>-1</sup>.

**Figure S6.** Aromatic distribution of the  $\text{Fe}_2\text{O}_3@\text{KO}_2/\text{ZSM-5}$  bifunctional catalyst. 375 °C, 30 bar,  $\text{H}_2/\text{CO}_2=3$ , and  $5000 \text{ mL} \cdot \text{g}^{-1} \cdot \text{h}^{-1}$ .

**Figure S7.** Effect of the spatial arrangement on the product distribution for the  $\text{Fe}_2\text{O}_3@KO_2/\text{ZSM-5}$  and  $\text{Fe}_2\text{O}_3@KO_2/\text{MOR}$  bifunctional catalysts. Reaction conditions: 375 °C, 30 bar,  $\text{H}_2/\text{CO}_2=3$ , and 5000  $\text{mL}\cdot\text{g}^{-1}\cdot\text{h}^{-1}$ .

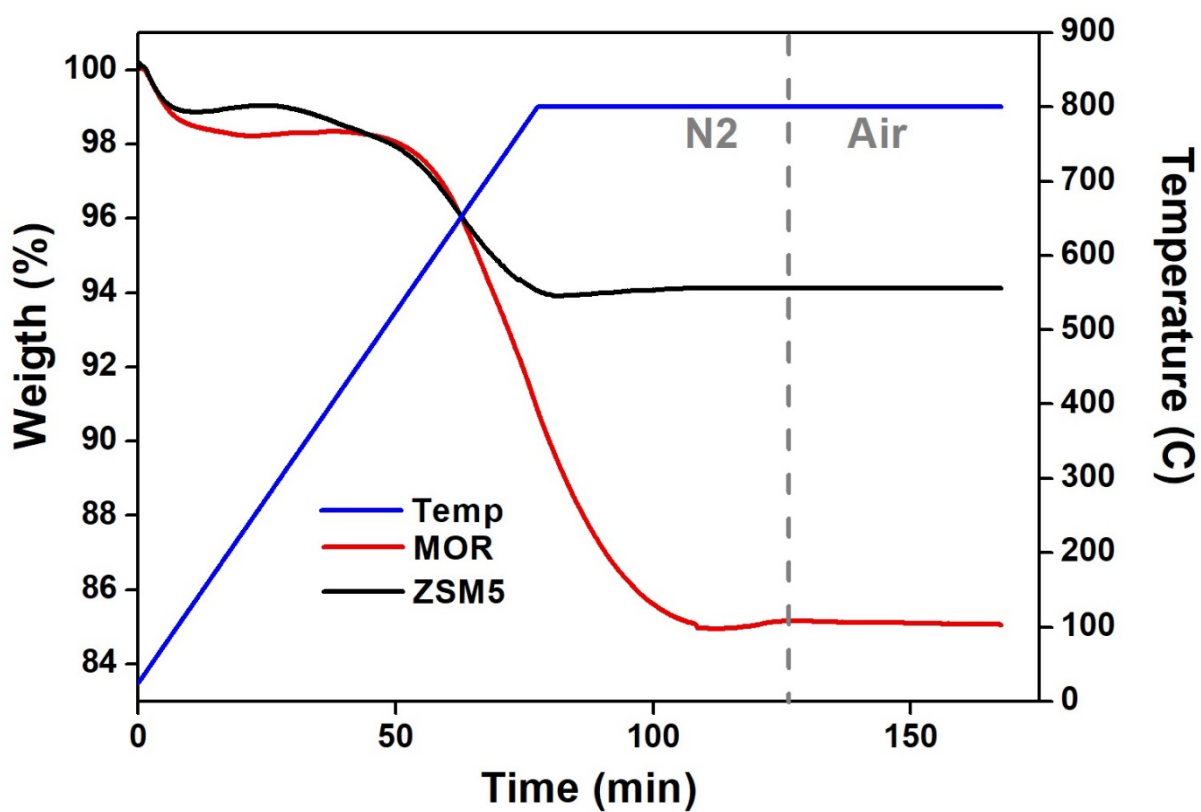

**Figure S8.** Effect of the reaction conditions on the aromatics selectivity and CO<sub>2</sub> conversion for the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/ZSM-5 bifunctional catalyst.

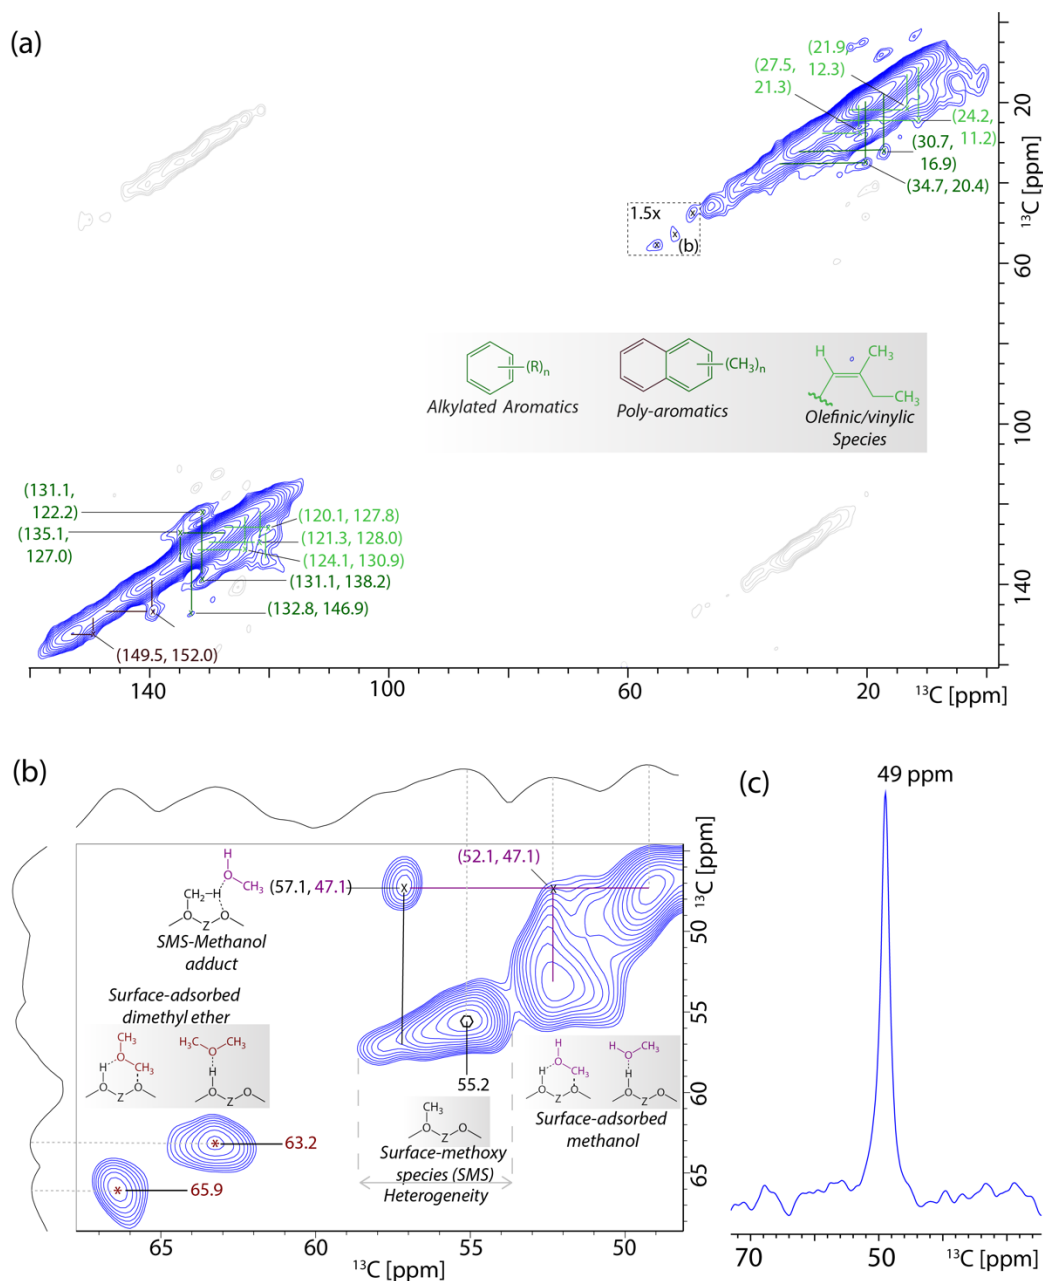

**Figure S9.** Effect of the reaction conditions on the light olefins selectivity and CO<sub>2</sub> conversion for the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/MOR bifunctional catalyst.

**Figure S10.** 1D  $^1\text{H}$ - $^{13}\text{C}$  cross-polarization MAS solid-state NMR spectra of zeolite trapped products, i.e. ZSM-5 (blue, 10 kHz MAS, NS=21392) and MOR (red, 10 kHz, NS=36592). The spectra of trapped products are obtained on the post-reacted zeolites after the hydrogenation of carbon dioxide over  $\text{Fe}_2\text{O}_3@/\text{KO}_2/\text{zeolite}$  for 50 hours (\* = spinning sideband, NS= number of scans, MAS= magic angle spinning).

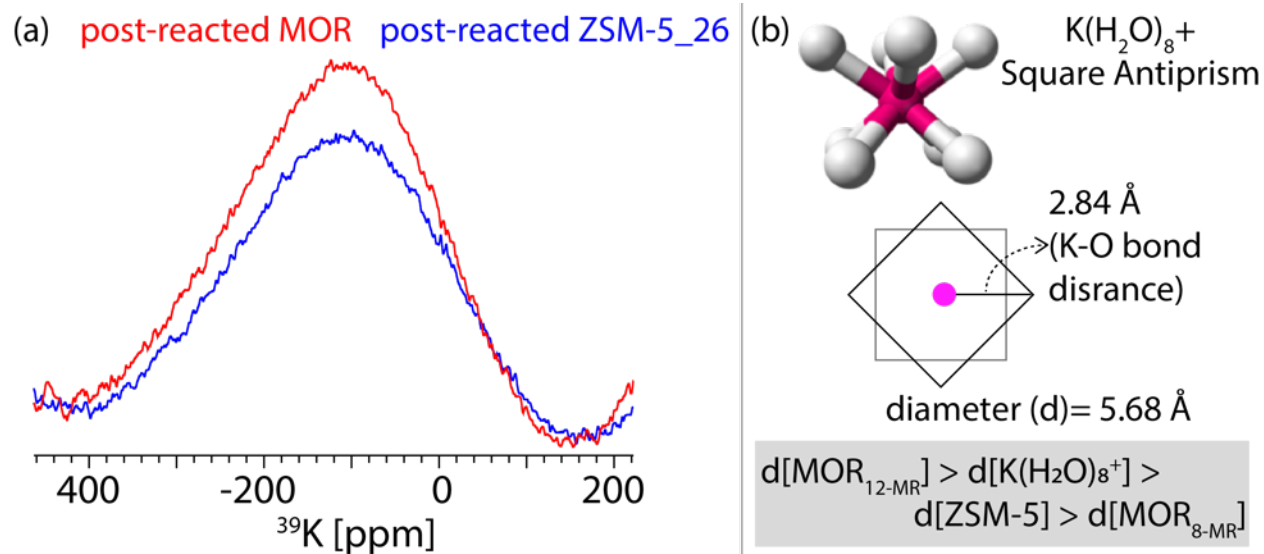

**Figure S11.** Thermo-gravimetric analysis (TGA) of the spent ZSM-5 and MOR zeolites after 50 hours of reaction.

**Figure S12.** 2D MAS  $^{13}\text{C}$ - $^{13}\text{C}$  solid-state NMR correlations of identified zeolite ZSM-5 trapped molecular scaffolds: (a) olefinic/vinylic (in light green), mono-aromatics (in green), poly-aromatics (in brown), and (b) alkoxy species (in purple). Spectra obtained on (a) the post-reacted ZSM-5 after the hydrogenation of carbon dioxide over  $\text{Fe}_2\text{O}_3@ \text{KO}_2/\text{ZSM-5}$  for 50 hours (number of scans = 2048, MAS= magic angle spinning). This measurement also demonstrates the degree of alkylation, such as ethyl groups (for example, 34.7 ↔ 20.4) were identified too along with

methyl groups (see also Figure S11). (b) Zooms of only alkoxy region showcase the existence of surface-adsorbed methanol, surface-methoxy species (SMS), and surface-adsorbed dimethyl ethers in a relatively lower quantity. (C) 1D  $^1\text{H}$ - $^{13}\text{C}$  cross-polarization MAS solid-state NMR spectra of zeolite-adsorbed methanol species. This measurement was performed to confirm the assignment of zeolite surface-adsorbed methanol.

**Figure S13.**  $^{39}\text{K}$  solid-state NMR spectra at 21.1 T and 298 K of (a) post-reacted ZSM-5 (blue, 10 kHz MAS, NS= 60064) and MOR (red, 10 kHz MAS, NS=78208) samples. The very broad spectral feature of both samples possibly could be attributed to the hydrated nature of potassium, i.e. (b)  $\text{K}(\text{H}_2\text{O})_8^+$  (with square antiprism structure), which has been migrated from the metallic part to the zeolitic part of the dual-bed catalytic system during the reaction.

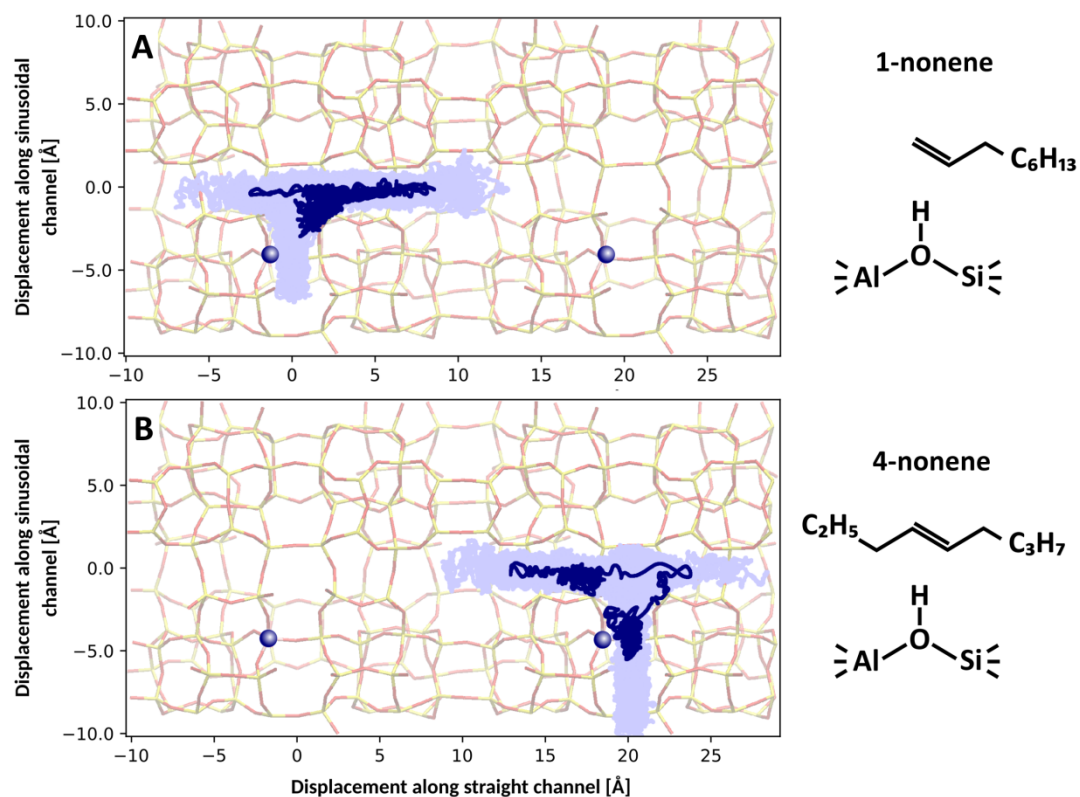

**Figure S14.** Four adsorption states of 1-nonene – (i) van der Waals complex; (ii)  $\pi$ -complex; (iii) carbenium ion; (iv) alkoxide.

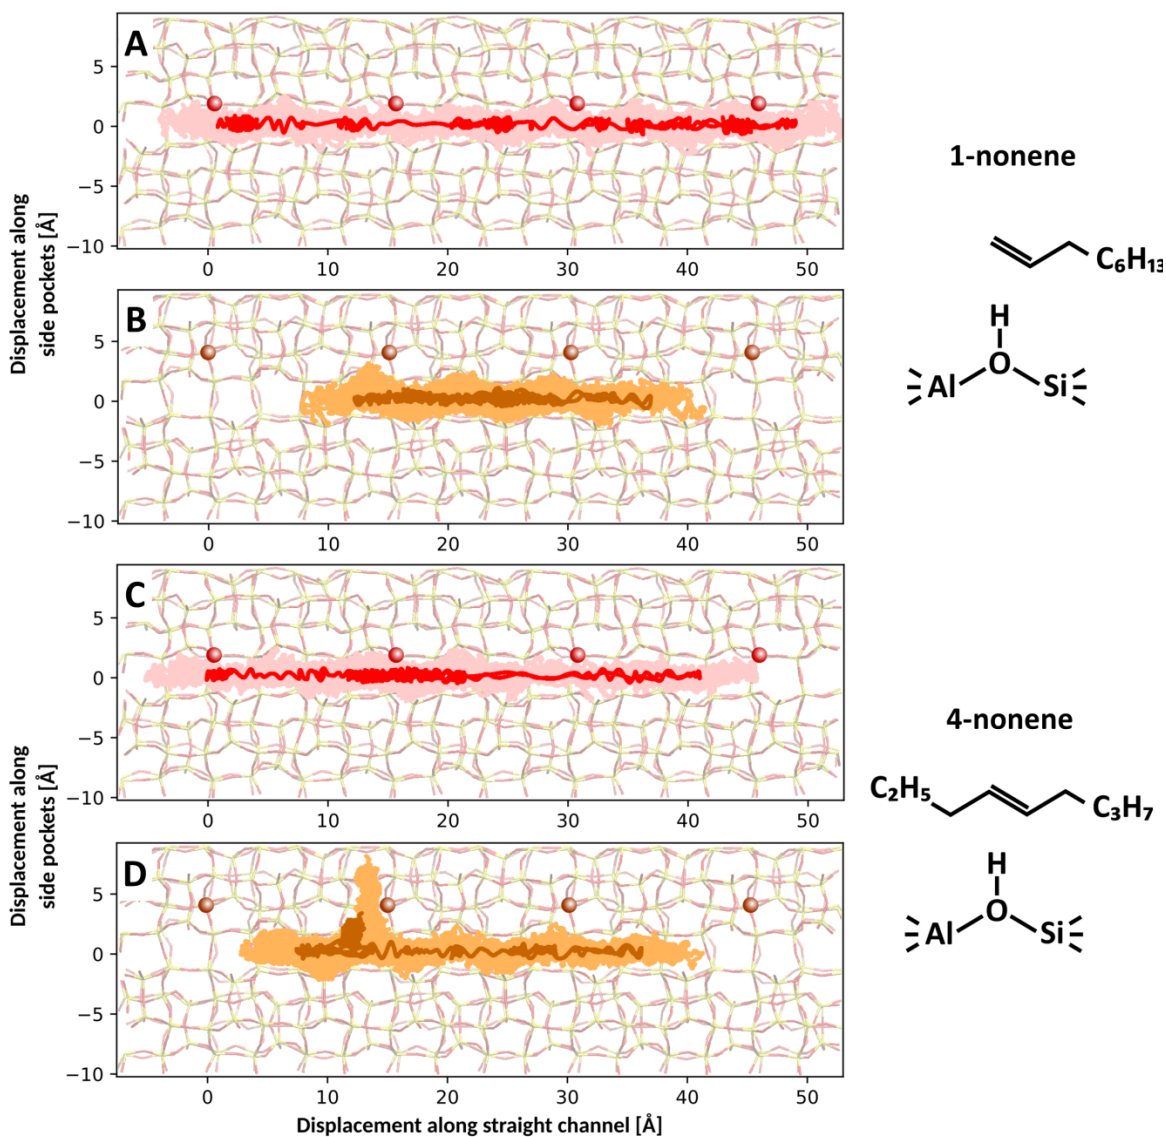

**Figure S15.** Adsorption enthalpy at 350°C for 1-, 2-, 3-, 4-nonene and 2-nonyl carbenium ion in H-ZSM-5, H-MOR-1 and H-MOR-2 with the empty framework and the respective n-nonene in gas phase as reference state. For the carbenium ion, gas phase 1-nonene and the empty framework are chosen as reference. (Level of theory: PBE-D3)

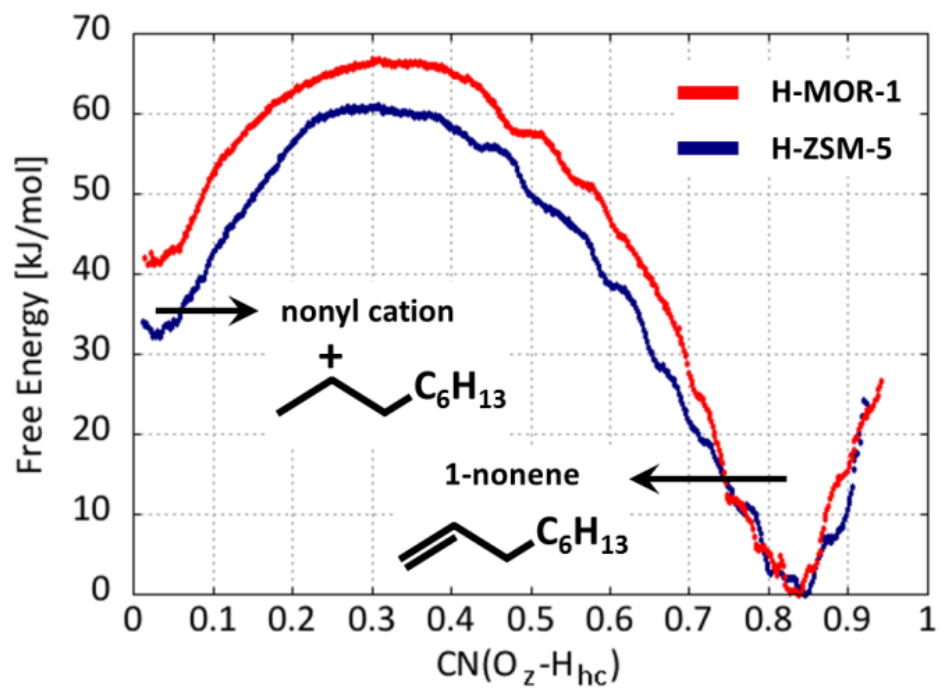

**Figure S16.** Static geometries of adsorbed 1-nonene (top) and 4-nonene (bottom)  $\pi$ -complex in left: H-MFI (sinusoidal channel view), middle: H-MOR-1 (side pocket view) and right: H-MOR-2 (main channel view).

**Figure S17.** Scatter plot of the mobility of (A) 1-nonene and (B) 4-nonene in the channel system of H-ZSM-5 during the 100 ps MD simulation at 350°C. The acid site is represented by the blue sphere. The occupied unit cell volume is indicated by the light blue color, while the center-of-mass position is plotted in the dark blue color.

**Figure S18.** Scatter plot of the mobility of (A) 1-nonene in H-MOR-1, (B) 1-nonene in H-MOR-2, (C) 4-nonene in H-MOR-1 and (D) 4-nonene in H-MOR-2 in the channel system of MOR during the 100 ps MD simulation at 350°C. The acid site is represented by the red (H-MOR-1) or orange (H-MOR-2) sphere. The occupied unit cell volume is indicated by the light color, while the center-of-mass position is plotted in the dark color.

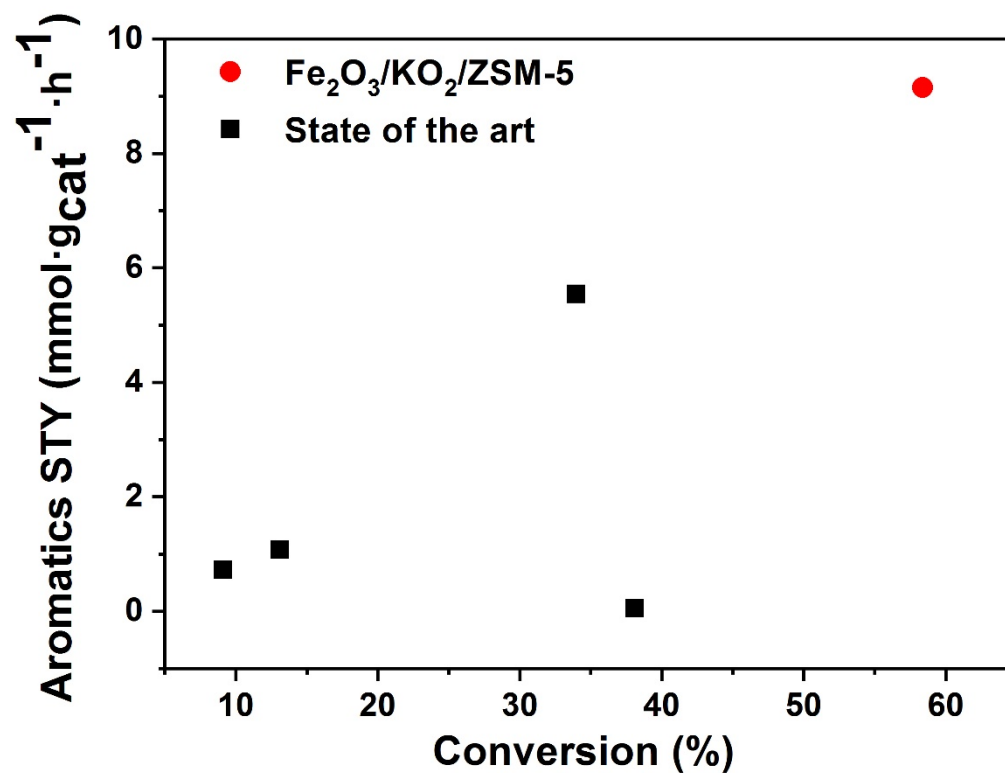

**Figure S19.** Free energy profiles for the protonation of 1-nonene into a nonyl carbenium ion in H-ZSM-5 (blue) and H-MOR-1 (red) at 350°C. (Level of Theory: revPBE-D3/TZVP-GTH)

**Figure S20.** C<sub>2</sub>–C<sub>4</sub>= light olefins STY (mmol·gcat<sup>-1</sup>·h<sup>-1</sup>) obtained in this work for the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/MOR catalyst compared to the best bifunctional catalysts available for CO<sub>2</sub> hydrogenation.

**Figure S21.** Aromatics STY (mmol·gcat<sup>-1</sup>·h<sup>-1</sup>) obtained in this work for the Fe<sub>2</sub>O<sub>3</sub>@KO<sub>2</sub>/ZSM-5 catalyst compared to the best bifunctional catalysts available for CO<sub>2</sub> hydrogenation.
