1. GENERAL INFORMATION

Unless stated otherwise, reagents were obtained from commercial sources and used without purification. New compounds have been fully characterized. NMR characterization was performed on reported ones. $^1$H-NMR spectra were recorded on Bruker Avance DPX-400 or DPX-600 (600 MHz), with the residual solvent peak as the internal reference (CDCl$_3$ = 7.26 ppm). $^1$H resonances are reported to the nearest 0.01 ppm. $^{13}$C-NMR spectra were recorded on the same spectrometer with proton decoupling, with the solvent peak as the internal reference (CDCl$_3$ = 77.00 ppm). All 13C resonances are reported to the nearest 0.01 ppm. DEPT 135, COSY, HMQC, and HMBC experiments were used to aid structural determination and spectral assignment. The multiplicity of $^1$H signals are indicated as: s = singlet, d = doublet, dd = doublet of doublets, ddd = doublet of doublets of doublets, t = triplet, q = quadruplet, sext = sextet, m = multiplet, br = broad, or combinations of thereof. Coupling constants (J) are quoted in Hz and reported to the nearest 0.1 Hz. Where appropriate, measures of the same coupling constant are averaged. Unless stated otherwise, reagents were obtained from commercial sources and used without purification. The removal of solvent under reduced pressure was carried out on a standard rotary evaporator. High resolution mass spectrometry (HRMS) was performed using a Waters Micromass LCT Premier™ spectrometer using time of flight with positive ESI, or a Bruker BioApex 47e FTICR spectrometer using (positive or negative) ESI or EI at 70 eV to within a tolerance of 5 ppm of the theoretically calculated value. Infrared spectra were recorded on a Perkin-Elmer Spectrum RX One FT-IR ATR (Attenuated Total Reflectance) spectrometer. The samples were prepared as thin films deposited on the ATR, unless otherwise specified. Only structurally important absorptions are quoted. Absorption maxima ($\nu_{\text{max}}$) are reported in wavenumbers (cm$^{-1}$). Optical rotations were measured on a Perkin-Elmer Polarimeter 343 at 589 nm (Na D-line) with a path length of 10 cm path length. Concentration (c) are quoted in g per 100 mL and specific rotations, $[\alpha]_D^{24}$ are reported in units of 10$^{-1}$cm$^2$g$^{-1}$ at 24 $^\circ$C. Melting points were using an OptiMelt automated melting point system available from Standford Research Systems. High pressure liquid chromatography (HPLC) was run on an Agilent Technologies 1100 Series HPLC with wavelength monitoring at 210 and 254 nm, using a Daicel Chiralpak AD-H column (250 mm x 4.6 mm I.D.; pore size: 50 μm). The flow experiments were performed on Uniqsis FlowSyn module$^1$ or a Vapourtec R2+R4 module.$^2$ Back pressure regulator is indicated as BPR. All gas-flow reactions were performed with a tube-in-tube reactor as described to introduce gases into a continuous flow stream. For the design of the tube-in-tube reactor see previous publications.$^3$ Omnifit® columns$^4$ were used for the containment of polymer-supported reagent or other solid reagents.
2. Preparation of a precursor to the sacubitril

Flow synthesis of 4-phenylstyrene 11

4-Iodobiphenyl 10 (420 mg, 1.5 mmol), Cy3NMe (0.39 mL, 1.8 mmol), Pd(OAc)2 (3 mg, 1 mol%) and tBu3PH (9 mg, 2 mol%) were dissolved in PhMe/MeOH (5 mL, 9:1). The reaction mixture was injected into a Uniqsis Flowsyn reactor via a 5 mL PEEK injection loop. The reaction plug was pumped at 1.0 mL min⁻¹ (using PhMe/MeOH (9:1) as stock solvent) through a tube-in-tube gas reactor pressurized with ethylene (15 bar) followed by a 20 mL PTFE reaction coil at 120 °C. The exiting reaction stream passed through an Omnifit column containing a mixture of QP-TU and QP-SA followed by a 200 psi BPR. The output was directed into a pre-weighed flask and flushed with argon. The solvent was removed in vacuo to provide 268 mg (99%) of the title compound 11 as a white crystalline solid.

1H NMR (400 MHz, CDCl3) δ 7.64 (d, J = 7.2 Hz, 2H), 7.61 (d, J = 8.3 Hz, 2H), 7.52 (d, J = 8.3 Hz, 2H), 7.48 (t, J = 7.4 Hz, 2H), 7.38 (t, J = 7.4 Hz, 1H), 6.78 (dd, J = 17.6, 11.0 Hz, 1H), 5.83 (d, J = 17.6 Hz, 1H), 5.31 (d, J = 11.0 Hz, 1H).

Flow synthesis of (4-Biphenyl)acetaldehyde 7

4-Phenylstyrene 11 (72 mg, 0.4 mmol) was dissolved in PhMe/BuOH (1:6, 2 mL) and loaded into injection loop A (2 mL). (MeCN)2PdCl2 (5 mg, 5 mol%), CuCl2 (3 mg, 5 mol%) and H2O (0.01 mL, 0.56 mmol) were dissolved in PhMe/BuOH (1:6, 2 mL) and loaded into injection loop B (2 mL). Both reagents were then pumped using a Uniqsis Flowsyn reactor via the 2 mL PEEK injection loops A and B at a combined flow rate of 0.5 mL min⁻¹ (using PhMe/BuOH (1:6) as stock solvent). The combined reagent stream was the passed through a tube-in-tube reactor pressurized with dry O2 (8 bar) followed by a 30 mL stainless steel reaction coil at 60 °C. The output stream then passed through an Omnifit column containing QP-TU and a 150 psi BPR, directed into a round-bottom flask. The flask was purged throughout the reaction with a stream of argon. The solvent was removed under vacuum and the crude residue purified by silica gel column chromatography to yield 63 mg (80%) of the title compound 7 as a white crystalline solid.

To a stirred solution of (4R)-5-(4-biphenylyl)-4-[(S)-tert-butylsulfanylamo]-2-methylenepentanoic acid ethyl ester 13 (28 g, 68 mmol) in THF (500 mL) at 0 °C was added a solution of lithium hydroxide (9 g) in H₂O (300 mL). The reaction mixture was allowed to warm to room temperature and stirred for 6 h. The reaction was quenched by addition of phosphoric acid (85% v/v) until pH 3-4 was obtained. Et₂O (500 mL) was added and the aqueous layer removed. The remaining organic layer was washed with brine (100 mL), dried with MgSO₄ and the solvent removed under vacuum. The residue was weighed flask and flushed with argon. The reaction mixture was filtered through celite and the filtrate was concentrated in vacuo. The residue was dissolved in the minimum amount of CH₂Cl₂ followed by slow addition of hexane to precipitate 25.2 g (98%) of titled compound 6 as a white amorphous solid.
