Fig. S2. Analysis of 27 co-regulated proteins by polyamines treatments. (A) Magnified views of 11 increased proteins and 14 decreased proteins and 2 differentially displayed proteins (B) by polyamines treatments. (C) (D) The relative protein levels of 11 increased proteins and 14 decreased proteins and 2 differentially displayed proteins by polyamines treatments. The results shown are the means ± SE of 3 independent experiments. Asterisk symbols indicate significant differences in comparison to wild type without polyamine treatment (p<0.05).
