Visualization of protein fouling inside a hollow fiber ultrafiltration membrane by fluorescent microscopy

Yan Hao, Cui Liang, Akihito Moriya, Hideto Matsuyama*, Tatsuo Maruyama*

Figure S1 Detail geometry of a laboratory-scale minimodule used for membrane filtration.
**Figure S2** Fluorescent microscope image of cross-section of the FITC-filtrated PES membrane with MWCO 30 kDa. A solution containing 26 μM FITC, preincubated for 12 h to hydrolyze FITC, was permeated through a PES membrane with MWCO 30 kDa for 2 h.
