GENERAL TECHNIQUES

All reactions were carried out in oven-dried or flame-dried glassware under a nitrogen atmosphere unless otherwise stated. Analytical thin layer chromatography was performed using 0.2 mm Kieselgel F254 (Merck) silica plates and compounds were visualized under 365 nm ultraviolet irradiation followed by staining with either alkaline permanganate or ethanolic vanillin solution. Infrared spectra were obtained using a Perkin Elmer spectrum One Fourier Transform Infrared spectrometer as thin films between sodium chloride plates. Absorption maxima are expressed in wavenumbers (cm\(^{-1}\)). Optical rotations were measured using a Perkin-Elmer 341 polarimeter at \(\lambda = 598\) nm and are given in \(10^{-1}\) deg cm\(^2\) g\(^{-1}\). Melting points were recorded on an Electrothermal melting point apparatus and are uncorrected. NMR spectra were recorded as indicated on either a Bruker DRX-400 spectrometer operating at 400 MHz for \(^1\)H nuclei and 100 MHz for \(^{13}\)C nuclei or on a Bruker Avance 300 spectrometer operating at 300 MHz and 75 MHz for \(^1\)H and \(^{13}\)C nuclei, respectively. Chemical shifts are reported in parts per million (ppm) relative to the tetramethylsilane peak recorded as \(\delta 0.00\) ppm in CDCl\(_3/\) TMS solvent, or the residual chloroform (\(\delta 7.26\) ppm), DMSO (\(\delta 2.50\) ppm) or methanol (\(\delta 3.31\) ppm) peaks. The \(^{13}\)C NMR values were referenced to the residual chloroform (\(\delta 77.1\) ppm), DMSO (\(\delta 39.5\) ppm) or methanol (\(\delta 49.0\) ppm) peaks. \(^{13}\)C NMR values are reported as chemical shift \(\delta\), multiplicity and assignment. \(^1\)H NMR shift values are reported as chemical shift \(\delta\), relative integral, multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet), coupling constant (\(J\) in Hz) and assignment. Assignments are made with the aid of DEPT 135, COSY, NOESY and HSQC experiments. High resolution mass spectra were recorded on a VG-70SE mass spectrometer at a nominal accelerating voltage of 70 eV.
EXPERIMENTAL PROCEDURES

(R)-2-tert-Butyloxirane [(R)-8]

Following the procedure outlined by Jacobsen et al.\(^1\) the *title compound* (2.15 g, 21.5 mmol, 43\%) was isolated as a colourless oil.

\(^1\)H NMR (400 MHz, CDCl\(_3\)): \(\delta_H = 0.89\) (s, 9 H, \(^t\)Bu), 2.55-2.57 (m, 1 H, CH of CH\(_2\)), 2.59-2.61 (m, 1 H, CH), 2.68-2.70 (m, 1 H, CH of CH\(_2\)).

Spectroscopic data is consistent with that reported in the literature.\(^1,2\)

(S)-2,2,5-Trimethylhex-5-en-3-ol

To a stirred suspension of CuI (0.16 g, 0.82 mmol, 10 mol\%) in THF (10 mL) \(-78\) °C was added a solution of isopropenylmagnesium bromide in THF (23 mL, 0.5 M, 14 mmol). (R)-8 (1 mL, 8.2 mmol) was added dropwise while the temperature was maintained at \(-78\) °C, the solution turned a darker red/yellow color and was allowed to warm to \(-25\) °C and stirred for 16 h. The solution was allowed to warm to 0 °C and stirred for a further 1 h, then quenched with ammonium chloride solution. The aqueous phase was extracted with ether (2 x 25 mL) and the combined organic phases dried (MgSO\(_4\)) filtered and concentrated in vacuo. The crude product was purified by flash chromatography on silica gel eluting with ethyl acetate-hexanes (1:4) to give the *title compound* (0.77 g, 5.44 mmol, 66\%) as a light yellow oil.

\(^1\)H NMR (400 MHz, CDCl\(_3\)): \(\delta_H = 0.91\) (s, 9 H, \(^t\)Bu), 1.67 (br s, 1 H, OH), 1.75 (s, 3 H, Me), 1.98 (dd, \(J = 11.2, 13.2\) Hz, 1 H, CH of CH\(_2\)), 2.23 (d, \(J = 13.6\) Hz, 1 H, CH of CH\(_2\)), 3.33 (dd, \(J = 2.8, 10.8\) Hz, 1 H, CH), 4.80 (s, 1 H, CH of CH\(_2\)), 4.88 (s, 1 H, CH of CH\(_2\)).

**(5R,7R)-7-Hydroxy-5,8,8-trimethylnonanoic acid**

![7-Hydroxy-5,8,8-trimethylnonanoic acid](image)

To a solution of methyl 7-hydroxy-5,8,8-trimethylnonanoate (100 mg, 0.43 mmol) in a dichloromethane/methanol (5 mL, 9:1), was added a methanolic solution of sodium hydroxide (112 mg,
in 1 mL, 2.8 mmol). After 2.5 h stirring at room temperature, the solvents were concentrated in vacuo and residue was diluted with water (10 mL), then washed with ether (2 x 10 mL) and the organic phases discarded. The aqueous phase was then cooled (0 °C) and acidified (pH 2-3) with dilute aqueous hydrochloric acid and extracted with dichloromethane (3 x 10 mL). The combined organic phases dried (MgSO₄), filtered and the solvent was concentrated in vacuo to give the title compound (86 mg, 0.39 mmol, 91% yield) as a clear oil.

1H NMR (400 MHz, CDCl₃): δ_H = 0.87 (s, 9 H, 'Bu), 0.94 (d, J = 6.8 Hz, 3 H, Me), 1.03-1.14 (m, 1 H, CH of CH₂), 1.17-1.24 (m, 1 H, CH of CH₂), 1.37 (ddd, J = 2.0, 9.6, 14.4 Hz, 1 H, CH of CH₂), 1.43-1.52 (m, 1 H, CH of CH₂), 1.53-1.62 (m, 1 H, CH of CH₂), 1.63-1.77 (m, 2 H, CH + CH of CH₂), 2.34 (dt, J = 8.0, 14.8 Hz, 2 H, CH₂), 3.28 (dd, J = 1.6, 10.0 Hz, 1 H, CH), CO₂H and OH not observed.

To a solution of (5R,7R)-7-hydroxy-5,8,8-trimethylnonanoic acid (86 mg, 0.4 mmol) in dichloromethane (8.0 mL) was added HOAt (55 mg, 0.4 mmol), N-methylallylamine (46 µL, 0.48 mmol), and EDCI (62 mg, 0.4 mmol). The reaction mixture was stirred for 4 h and solvent was concentrated in vacuo. The crude product was purified by flash chromatography on silica gel eluting with methanol-ethyl acetate (1:19) to give the title compound as a 1:1 mixture of rotamers (92 mg, 0.34 mmol, 85% yield) as a clear oil.
