## GENERAL EXPERIMENTAL METHODS

**Methods and Materials:** Unless otherwise stated, commercially available reagents were used as purchased. Solvents were dried by passage through activated alumina columns of a solvent purification system: tetrahydrofuran (THF), dichloromethane ( $\text{CH}_2\text{Cl}_2$ ), 1,2-dichloroethane [ $(\text{CH}_2\text{Cl})_2$ ], diethylether ( $\text{Et}_2\text{O}$ ), acetonitrile ( $\text{MeCN}$ ), *N,N*-Dimethylformamide (DMF), and toluene ( $\text{PhMe}$ ). Diisopropylamine [ $(i\text{-Pr})_2\text{NH}$ ] and triethylamine ( $\text{Et}_3\text{N}$ ) were distilled from  $\text{CaH}_2$  and stored over activated 3 Å molecular sieves. Methanol was distilled from magnesium and stored over activated 3 Å molecular sieves. Isopropanol was distilled from sodium and stored over activated 3 Å molecular sieves.  $\text{CDCl}_3$  was stored under argon over activated 4 Å molecular sieves.

Allyl vinyl ether **S11e** was prepared according to a published procedure.<sup>1</sup>

The concentration of *n*-BuLi was determined employing diphenylacetic acid as indicator.<sup>2</sup>

All moisture-sensitive reactions were performed in flame-dried septum-sealed glassware under an atmosphere of argon. Reagents were transferred by means of syringe or cannula.

Analytical TLC was performed using pre-coated silica gel foils (4 cm). Visualization was achieved using 254 nm ultraviolet irradiation followed by staining with the Kägi-Miescher reagent<sup>3</sup> (*p*-anisaldehyde 2.53 vol%, acetic acid 0.96 vol%, ethanol 93.06 vol%, conc.  $\text{H}_2\text{SO}_4$  3.45 vol%) or the  $\text{KMnO}_4$  reagent (3 g  $\text{KMnO}_4$ , 20 g  $\text{K}_2\text{CO}_3$ , 5 mL NaOH (5%), 300 mL  $\text{H}_2\text{O}$ ).

Flash chromatography<sup>4</sup> was performed using silica gel (particle size 0.040–0.063 mm) and mixtures of cyclohexane and ethyl acetate, heptane and ethyl acetate or *n*-pentane and diethyl ether were used as eluents.

<sup>1</sup>H NMR spectra were recorded at 300 MHz, 400 MHz, 500 MHz, or 600 MHz. Chemical shifts are reported in ppm relative to chloroform ( $\delta$  7.26 ppm).<sup>5</sup> Signal splitting patterns are labeled by the following abbreviations: s = singlet, d = doublet, t = triplet, q = quartet, spt = septet, m = multiplet or overlap of non equivalent resonances. <sup>13</sup>C NMR spectra were recorded at 76 MHz, 101 MHz or 126 MHz. Chemical shifts are reported in ppm relative to  $\text{CDCl}_3$  (77.16 ppm) or  $\text{DMSO-}d_6$  (39.51 ppm).<sup>5</sup> The assignment of  $\text{CH}_2$  is based on APT (attached proton test) or DEPT (distortionless enhancement by polarization transfer) experiments. The terms ““major”” and ““minor”” are used to distinguish between NMR resonances of diastereomers. Where appropriate, the peak assignments were confirmed by 2D NMR experiments: <sup>1</sup>H,<sup>1</sup>H-COSY, <sup>1</sup>H,<sup>1</sup>H-NOESY, <sup>1</sup>H,<sup>13</sup>C-HSQC, and <sup>1</sup>H,<sup>13</sup>C-HMBC.

For NMR kinetic experiments, <sup>1</sup>H NMR measurements were performed with a 500 MHz NMR spectrometer UnityINOVA-500 (Varian) equipped with a 5 mm triple resonance probe H(C,X). All measurements used the same conditions (spectral width 5500 Hz, acquisition time 5.96 s, 64 kB data, 90° pulse width 10.3  $\mu\text{s}$ ). The kinetic measurements were setup as array experiments. In this case the preacquisition time was arrayed from 0 to 69 hours. Each spectrum was measured with a single scan. The processing was executed by using zero filling (256 kB).

Infrared spectra were recorded as a thin film on a KBr disk (“film on KBr”). Absorption bands are reported in reciprocal wave length ( $\text{cm}^{-1}$ ). The intensity of the absorption bands is labeled by the following abbreviations: s = strong, m = middle, w = weak, br = broad; the vibration modes are labeled as follows:  $\nu$  = valence vibration,  $\delta$  = deformation vibration. The assignment of functional groups is based on tabulated values.<sup>6</sup>

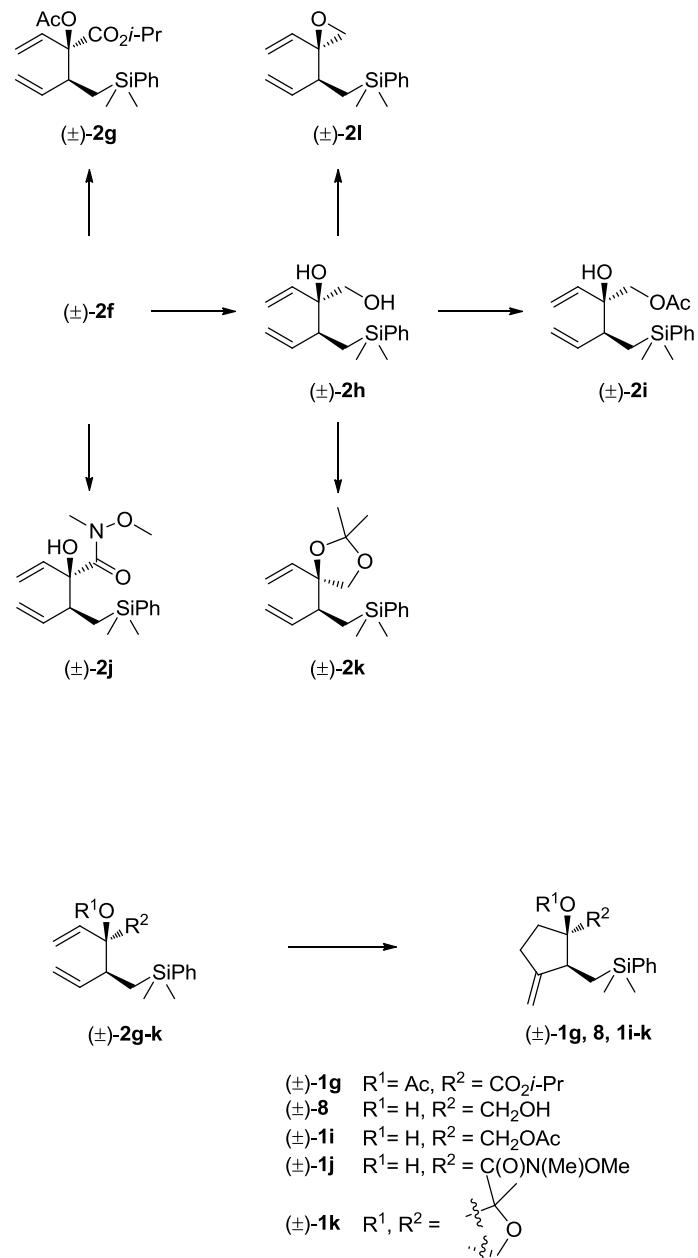

Molecular formula assignment was confirmed by combustion elemental analysis. High resolution mass spectra were recorded on a LTQ Orbitrap spectrometer by electrospray ionization (ESI).

## EXPERIMENTAL PROCEDURES AND ANALYTICAL DATA

**[Pd(MeCN)<sub>4</sub>](BF<sub>4</sub>)<sub>2</sub><sup>7</sup>:** Pd(0)-Sponge (0.16 g, 1.5 mmol, 1 eq) and NOBF<sub>4</sub> (0.35 g, 3 mmol, 2 eq) were successively added to MeCN (7.5 ml, 5 ml/mmol Pd) (degased by three cycles of “freeze-pump-thaw”) in a Schlenk-tube. The resulting mixture was stirred at room temperature under a slow flow of argon (24 h – 7 d, scale dependent) and exclusion of light. The yellow solution was filtered carefully into a Schlenk-tube containing anhydrous Et<sub>2</sub>O (100 ml), where a yellow precipitate formed. The mixture was allowed to settle and the solvent was removed with a syringe. The yellow precipitate was washed with anhydrous Et<sub>2</sub>O (20 ml) and subsequently dried under vacuum (5×10<sup>-2</sup> mbar) to afford [Pd(MeCN)<sub>4</sub>](BF<sub>4</sub>)<sub>2</sub> (0.64 g, 1.45 mmol, 96%) as a bright yellow powder. <sup>1</sup>H NMR (CD<sub>3</sub>NO<sub>2</sub>, 400 MHz, δ): 2.65 (s, 9H, 4×CH<sub>3</sub>); IR (nujol) (cm<sup>-1</sup>): 2355(w) (ν C≡N), 1060-1035(m) (BF<sub>4</sub><sup>-</sup>), 765(w) (BF<sub>4</sub><sup>-</sup>); Anal. Calcd. for C<sub>8</sub>H<sub>12</sub>B<sub>2</sub>F<sub>8</sub>N<sub>4</sub>Pd: C, 21.6; H, 2.7; N, 12.6; Found: C, 21.4; H, 2.7; N, 13.0; C<sub>8</sub>H<sub>12</sub>B<sub>2</sub>F<sub>8</sub>N<sub>4</sub>Pd, M = 444.24 g/mol.

The catalyst was stored in a Schlenk-tube under exclusion of light and used as long as it maintained a yellow to light-orange color. In our hands, commercial and self-synthesized batches of [Pd(MeCN)<sub>4</sub>](BF<sub>4</sub>)<sub>2</sub> exerted a discrete phenotype and reactivity: the latter one generally showed a higher activity in cycloisomerization reactions which was reflected in shorter reaction times. The commercial batches<sup>8</sup> of [Pd(MeCN)<sub>4</sub>](BF<sub>4</sub>)<sub>2</sub> appeared as off-white powder which ultimately changed its color to brown upon storage in a Schlenk-tube under exclusion of light over several months.

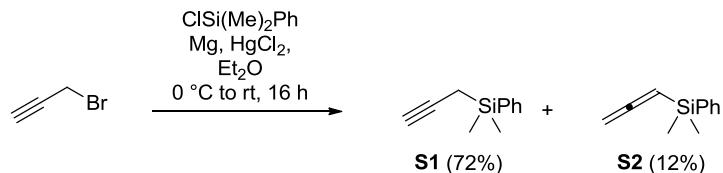

**[Pd(allyl)(MeCN)<sub>2</sub>](BF<sub>4</sub>)<sup>9</sup>:** [Pd(allyl)Cl]<sub>2</sub> (0.1 g, 0.27 mmol, 1 eq) and AgBF<sub>4</sub> (0.11 g, 0.56 mmol, 2.05 eq) were successively added to a solution of MeCN/CH<sub>2</sub>Cl<sub>2</sub> (2.8 ml, 1/1, 5 ml/mmol Pd) in a Schlenk-tube. The resulting mixture was stirred for 0.5 h at room temperature, until a white precipitate formed. The precipitate was filtered off and the clear solution was added dropwise into a Schlenk-flask containing anhydrous Et<sub>2</sub>O (50 ml). Upon addition, an off-white precipitate formed which was washed with Et<sub>2</sub>O (10 ml) and ultimately dried under vacuum (5×10<sup>-2</sup> mbar) to afford [Pd(allyl)(MeCN)<sub>2</sub>](BF<sub>4</sub>) (0.13 g, 0.40 mmol, 74%) as an off-white powder. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz, δ): 2.39 (s, 6 H), 3.18 (d, <sup>3</sup>J = 12.5 Hz, 2H), 4.34 (d, <sup>3</sup>J = 6.9 Hz, 2H), 5.63 (tt, <sup>3</sup>J = 12.5, 6.9 Hz, 1H); IR (cm<sup>-1</sup>): 2360(w) (ν C≡N), 2325(w), 1620(m) (ν C=C), 1385(s) (δ CH<sub>3</sub>), 1055(s) (BF<sub>4</sub><sup>-</sup>), 795(w) (BF<sub>4</sub><sup>-</sup>); Anal. Calcd. for C<sub>7</sub>H<sub>11</sub>BF<sub>4</sub>N<sub>2</sub>Pd: C, 26.6; H, 3.5; N, 8.9; Found: C, 26.5; H, 3.8; N, 8.7; C<sub>7</sub>H<sub>11</sub>BF<sub>4</sub>N<sub>2</sub>Pd, M = 316.40 g/mol.

**Propynyl silane S1<sup>10</sup>:** To an oven dried, three-necked-flask (equipped with a reflux condenser, a dropping funnel and a stopper, which is ultimately switched with a thermometer) under an atmosphere of argon was added Mg powder (5.1 g, 210 mmol, 2.1 eq) and  $\text{HgCl}_2$  (0.9 g, 3.3 mmol, 0.03 eq). The flask was heated with a heatgun, sealed with a septum and allowed to cool down to room temperature under an atmosphere of argon before  $\text{Et}_2\text{O}$  (50 mL, 0.25 mL/mmol Mg) was added carefully. The flask was cooled to  $0\text{ }^\circ\text{C}$  and propargylbromide (21.6 mL, 200 mmol, 2 eq, 80% in toluene) in  $\text{Et}_2\text{O}$  (50 mL, 0.25 mL/mmol bromide) was added dropwise over a period of 1.5 h. After addition of the first few drops the solution became cloudy and started to boil. The rate of the addition was adjusted to maintain the internal temperature between  $0\text{ }^\circ\text{C}$  and  $20\text{ }^\circ\text{C}$ . The dark solution was stirred further for 45 min at  $0\text{ }^\circ\text{C}$  before chlorodimethyl(phenyl)silane (16.5 mL, 100 mmol, 1 eq) in  $\text{Et}_2\text{O}$  (50 mL, 0.5 mL/mmol silane) was added dropwise over a period of 2 h. The resulting reaction mixture was allowed to warm to room temperature overnight (16 h) and was then diluted by the careful addition of saturated aqueous  $\text{NH}_4\text{Cl}$  solution and *n*-pentane (150 mL). The aqueous layer was extracted with *n*-pentane (3×) and the combined organic phases were dried ( $\text{MgSO}_4$ ) and concentrated under reduced pressure ( $\geq 5\text{ mbar}$ ). Purification by repeated flash chromatography (*n*-pentane/ $\text{Et}_2\text{O}$  500/1 → 100/1) afforded propynyl silane **S1** (12.6 g, 72 mmol, 72% combined) as a clear oil along with allene **S2**<sup>11</sup> (12%, determined by  $^1\text{H}$  NMR spectroscopy of a mixed fraction of **S1** and **S2**, which was further purified by flash chromatography).  $R_f$  0.54 (cyclohexane/ethyl acetate 20/1);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz,  $\delta$ ): 0.41 (s, 6H), 1.72 (d,  $^4J = 3.0\text{ Hz}$ , 2H), 1.86 (t,  $^4J = 3.0\text{ Hz}$ , 1H), 7.35–7.42 (m, 3H), 7.54–7.59 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 101 MHz,  $\delta$ ): –3.4 (2× $\text{CH}_3$ ), 6.4 ( $\text{CH}_2$ ), 67.6 ( $\text{CH}$ ), 82.2 (C), 128.0 (2× $\text{CH}_{\text{ar}}$ ), 129.6 ( $\text{CH}_{\text{ar}}$ ), 133.7 (2× $\text{CH}_{\text{ar}}$ ), 137.5 ( $\text{C}_{\text{ar}}$ ); IR ( $\text{cm}^{-1}$ ): 3310(m) (v C–H, alkyne), 3070(w) (v C–H, aromatic), 3050(m), 3025(w), 2960(m), 2895(w), 2120(m) (v  $\text{C}\equiv\text{C}$ ), 1620(m) (v  $\text{C}=\text{C}$ ), 1430(m), 1385(s), 1250(s), 1146(m), 1115(s);  $\text{C}_{11}\text{H}_{14}\text{Si}$ ,  $M = 174.31\text{ g/mol}$ .

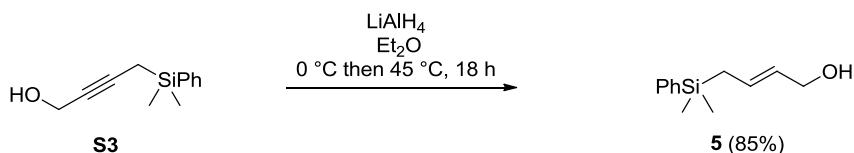

**Propargylic alcohol S3<sup>10b</sup>:** *n*-BuLi (24.2 mL, 59.2 mmol, 2.45 M solution in hexanes) was added dropwise to a solution of propynyl silane **S1** (10.3 g, 59.2 mmol, 1 eq) in  $\text{THF}$  (300 mL, 5 mL /mmol **S1**) at  $-78\text{ }^\circ\text{C}$  over a period of 20 min. The resulting pale yellow solution was stirred for 1 h at  $0\text{ }^\circ\text{C}$  before powdered paraformaldehyde (3.6 g, 118.4 mmol, 2 eq) was added in a single portion at  $0\text{ }^\circ\text{C}$ .

The reaction mixture was allowed to warm to room temperature over a period of 4 h and was then diluted by the addition of saturated aqueous  $\text{NH}_4\text{Cl}$  solution. The aqueous layer was extracted with  $\text{Et}_2\text{O}$  (3×) and the combined organic phases were dried ( $\text{MgSO}_4$ ) and concentrated under reduced pressure. Purification by flash chromatography (cyclohexane/ethyl acetate 50/1 → 10/1) afforded propargylic alcohol **S3** (10.1 g, 49.6 mmol, 84%) as a clear oil.  $R_f$  0.43 (cyclohexane/ethyl acetate 2/1);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz,  $\delta$ ): 0.40 (s, 6H), 1.38 (br t,  $^3J = 6.0$  Hz, 1H), 1.75 (t,  $^5J = 2.5$  Hz, 2H), 4.23 (dt,  $^3J = 6.0$  Hz,  $^5J = 2.5$  Hz, 2H), 7.34–7.43 (m, 3H), 7.52–7.59 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 101 MHz,  $\delta$ ): –3.3 (2× $\text{CH}_3$ ), 6.7 ( $\text{CH}_2$ ), 51.8 ( $\text{CH}_2$ ), 77.9 (C), 84.2 (C), 128.0 (2× $\text{CH}_{\text{ar}}$ ), 129.6 ( $\text{CH}_{\text{ar}}$ ), 133.7 (2× $\text{CH}_{\text{ar}}$ ), 137.5 (C<sub>ar</sub>); IR ( $\text{cm}^{-1}$ ): 3335 (br, m) (v O–H), 3070 (w) (v C–H, aromatic), 3050(w), 2960(m), 2880(w), 2220(m) (v C≡C), 1425(s), 1385(m), 1250(s), 1115(s), 1010(s);  $\text{C}_{12}\text{H}_{16}\text{OSi}$ , M = 204.34 g/mol.

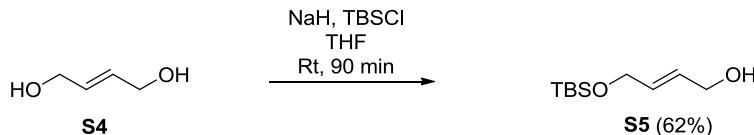

**Allylic alcohol 5<sup>10b</sup>:** A solution of propargylic alcohol **S3** (10.1 g, 49.6 mmol, 1 eq) in  $\text{Et}_2\text{O}$  (50 mL, 1 mL/mmol **S3**) was added dropwise to a suspension of  $\text{LiAlH}_4$  (2.8 g, 74.4 mmol, 1.5 eq) in  $\text{Et}_2\text{O}$  (200 mL, 4 mL/mmol **S3**) at 0 °C. After complete addition the resulting grey suspension was heated to 45 °C for a period of 18 h. The mixture was cooled to 0 °C and hydrolyzed by the careful addition of ethyl acetate (20 mL) and saturated aqueous Na/K tartrate solution (200 mL) until a light grey slurry has formed. The aqueous layer was extracted with ethyl acetate (3×) and the combined organic phases were dried ( $\text{MgSO}_4$ ) and concentrated under reduced pressure. Purification by flash chromatography (cyclohexane/ethyl acetate 50/1 → 5/1) afforded allylic alcohol **5** (8.7 g, 42.1 mmol, 85%) as a clear oil.  $R_f$  0.43 (cyclohexane/ethyl acetate 2/1);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 500 MHz,  $\delta$ ): 0.29 (s, 6H), 1.09 (br s, 1H), 1.74 (d,  $^3J = 8.0$  Hz, 2H), 4.03 (d,  $^3J = 6.2$  Hz, 2H), 5.46–5.55 (m, 1H), 5.63–5.71 (m, 1H), 7.32–7.40 (m, 3H), 7.47–7.53 (m, 2H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 101 MHz,  $\delta$ ): –3.3 (2× $\text{CH}_3$ ), 22.0 ( $\text{CH}_2$ ), 64.2 ( $\text{CH}_2$ ), 127.9 (2× $\text{CH}_{\text{ar}}$ ), 128.3 (CH), 129.2 (CH), 130.0 ( $\text{CH}_{\text{ar}}$ ), 133.7 (2× $\text{CH}_{\text{ar}}$ ), 138.5 (C<sub>ar</sub>); IR ( $\text{cm}^{-1}$ ): 3350(br m) (v O–H), 3070(w), 3050(w), 3020(w), 2955(m), 1660(w), 1425(s), 1405(m), 1250(s), 1155(m), 1115(s), 1080(m), 1000(s), 970(s), 835(s);  $\text{C}_{12}\text{H}_{18}\text{OSi}$ , M = 206.36 g/mol.

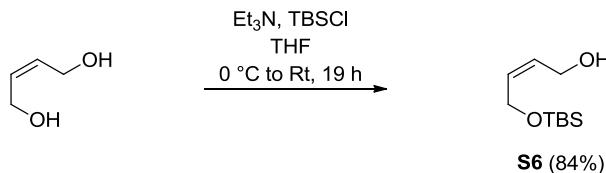

**Diol S4<sup>12</sup>:** A solution of but-2-yne-1,4-diol (10 g, 116 mmol, 1 eq) in THF (50 mL, 0.4 mL/mmol alcohol) was added dropwise to a suspension of  $\text{LiAlH}_4$  (10.2 g, 255 mmol, 2.2 eq) in THF (150 mL, 1.3 mL/mmol alcohol) at 0 °C. After complete addition the resulting suspension was heated to 70 °C for a period of 18 h. The reaction mixture was cooled to 0 °C and celite<sup>®</sup> (2.5 g) and THF (50 mL) were added and the resulting mixture carefully hydrolyzed by the addition of saturated aqueous  $\text{NH}_4\text{Cl}$  solution (13 mL). The reaction mixture was filtered and washed with THF and the solids extracted by soxhlet extraction (THF, 70 °C, 2 d). The combined organic phases were dried ( $\text{MgSO}_4$ ) and concentrated under reduced pressure. Kugelrohr distillation (3 mbar, 120 °C) afforded diol **S4** (7.3 g, 82

mmol, 71%) as a clear oil.  $R_f$  0.23 (ethyl acetate);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz,  $\delta$ ): 1.51 (br s, 2H), 4.17–4.20 (m, 4H), 4.85–4.95 (s, 2H);  $^{13}\text{C}$  NMR ( $\text{DMSO-}d_6$ , 101 MHz,  $\delta$ ): 61.1 (2 $\times$  $\text{CH}_2$ ), 130.0 (2 $\times$  $\text{CH}$ ); IR ( $\text{cm}^{-1}$ ): 3340(br s) (v OH), 2875(s), 2870(s), 1385(m), 1085(s), 990(m) ( $\delta$   $\text{CH}=\text{CH}$ );  $\text{C}_4\text{H}_8\text{O}_2$ , M = 88.15 g/mol.

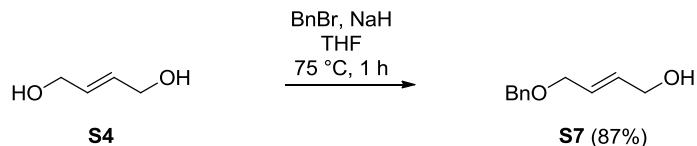

**Silyl ether S5<sup>13</sup>:** Allylic alcohol **S4** (2.3 g, 26.1 mmol, 1 eq) was added dropwise to a suspension of NaH (1 g, 26.1 mmol, 1 eq, 60% in mineral oil) [washed with *n*-hexane (3 $\times$ )] in THF (52 mL, 2 mL/mmol **S4**) at room temperature and the resulting mixture was stirred for a period of 45 min. During this time a white precipitate formed. TBSCl (3.9 g, 26.1 mmol, 1 eq) was added and the reaction mixture was stirred further for 45 min at room temperature. Subsequently water was added and the aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$  (3 $\times$ ). The combined organic phases were dried ( $\text{MgSO}_4$ ) and concentrated under reduced pressure. Purification by flash chromatography (cyclohexane/ethyl acetate 10/1  $\rightarrow$  2/1) afforded silyl ether **S5** (3.3 g, 16.1 mmol, 62%) as a clear oil.  $R_f$  0.40 (cyclohexane/ethyl acetate 5/1);  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400 MHz,  $\delta$ ): 0.07 (s, 6H), 0.90 (s, 9H), 1.59 (br s, 1H), 4.11–4.16 (m, 2H), 4.16–4.20 (m, 2H), 5.74–5.82 (m, 1H), 5.83–5.91 (m, 1H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ , 101 MHz,  $\delta$ ): −5.1 (2 $\times$  $\text{CH}_3$ ), 18.6 (C), 26.1 (3 $\times$  $\text{CH}_3$ ), 63.2 ( $\text{CH}_2$ ), 63.3 ( $\text{CH}_2$ ), 129.1 (CH), 131.0 (CH); IR ( $\text{cm}^{-1}$ ): 3350(br m) (v OH), 2930(s), 2860(s), 1260(s), 1100(s), 840(s);  $\text{C}_{10}\text{H}_{22}\text{O}_2\text{Si}$ , M = 202.37 g/mol.

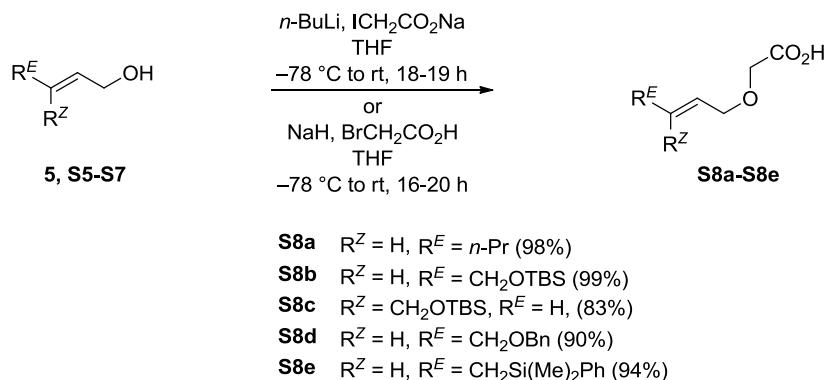

**Silyl ether S6<sup>14</sup>:** An ice-cooled solution of (*Z*)-but-2-ene-1,4-diol (10 mL, 121.7 mmol, 3 eq) in THF (10 mL, 0.09 mL/mmol alcohol) was treated successively with  $\text{Et}_3\text{N}$  (6.8 mL, 48.7 mmol, 1.2 eq) and a solution of TBSCl (6.1 g, 40.6 mmol, 1 eq) in THF (41 mL, 1 mL/mmol TBSCl) (dropwise over a period of 1 h). After complete addition the cooling bad was removed and the resulting suspension was allowed to warm to room temperature overnight (19 h). The reaction mixture was diluted with water (150 mL) and the aqueous layer extracted with  $\text{CHCl}_3$  (3 $\times$ ). The combined organic phases were dried ( $\text{MgSO}_4$ ) and concentrated under reduced pressure. **General procedure SI-A1: Etherification with sodium iodoacetate:** A solution of the allylic alcohol (1 eq) in THF (1–3 mL/mmol alcohol) was treated dropwise with *n*-BuLi (1.05 eq) at –78 °C. The cooling bath was removed and the solution was stirred at room temperature for 30 min. Sodium iodoacetate (1.05 eq) was added in a single portion and the resulting brown slurry stirred at room temperature overnight (18–19 h). After that time the reaction mixture was carefully diluted by the addition of 1 M KOH solution. The organic layer was extracted with 1 M KOH solution (3×). The combined KOH phases were cooled to 0 °C and treated with conc. HCl solution until pH ≤ 2 was reached and an organic layer formed. The acid aqueous layer was subsequently extracted with CH<sub>2</sub>Cl<sub>2</sub> (3×). The combined organic phases were dried (MgSO<sub>4</sub>) and concentrated under reduced pressure. The crude acid **S8** was used without further purification.

**General procedure SI-A2: Etherification with bromoacetic acid<sup>16</sup>:** NaH (3 eq, 60% in mineral oil) was added to a cooled (–78 °C) solution of bromoacetic acid (1–1.05 eq) in THF (1 mL/mmol alcohol) in multiple portions. The resulting suspension was stirred at –78 °C until the gas evolution had ceased (about 30 min). Subsequently, a solution of the allylic alcohol (1 eq) in THF (0.5–2 mL/mmol alcohol) was added dropwise and the resulting suspension was allowed to warm to room temperature overnight (16–20 h). After that time the reaction mixture was carefully diluted by the

**General procedure SI-C: Aldol addition:** A solution of LDA [prepared *in situ* from (*i*-Pr)<sub>2</sub>NH (1.3 eq) and *n*-BuLi (1.2 eq)] in THF (2 mL/mmol ester **S9**, **6**) was treated dropwise with a cooled (–78 °C) solution of the ester (1 eq) in THF (3 mL/mmol ester). After being stirred at –78 °C for 15–30 min, freshly distilled (1 atm, 40 °C), cooled acetaldehyde (2 eq) was added and the yellow solution was stirred further for 1–1.5 h at –78 °C. Subsequently aqueous saturated NH<sub>4</sub>Cl solution was added at –78 °C and the reaction mixture was allowed to warm to room temperature. The aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 $\times$ ). The combined organic phases were dried (MgSO<sub>4</sub>) and concentrated under reduced pressure. Purification by flash chromatography (cyclohexane/ethyl acetate 50/1 → 10/1 or 5/1) afforded the  $\beta$ -hydroxy ester **S10** as a mixture of diastereomers.<sup>21</sup>

<sup>22</sup> Allyl vinyl ether (AVE) **7** slowly undergoes a Gosteli–Claisen rearrangement to the corresponding  $\alpha$ -keto ester on exposure to  $0$  °C, room temperature or elevated temperatures (e.g. reaction of **7** in  $\text{CDCl}_3$  in a NMR tube for 19 d at ambient temperature afforded 88%  $\alpha$ -keto ester as determined by  $^1\text{H}$  NMR spectroscopy). Therefore, during reaction workup, concentration of the organic phases in vacuum should be conducted at temperature  $\leq$  room temperature. After purification, AVE **7** was used directly in the next step.

**General procedure SI-E: Dienolate [2,3]-Wittig rearrangement<sup>23</sup>:** A cooled ( $-85^{\circ}\text{C}$ ) solution of LDA [prepared *in situ* from  $(i\text{-Pr})_2\text{NH}$  (1.2–2 eq) and  $n\text{-BuLi}$  (1.1–1.8 eq)] in THF (2 mL/mmol **S11**, **7**) was treated dropwise with a cooled ( $-85^{\circ}\text{C}$ ) solution of allyl vinyl ether **S11**, **7** (1 eq, mixture of double bond isomers) in THF (3 mL/mmol **S11**, **7**). The resulting light yellow solution was stirred for a period of 30–45 min ( $-85^{\circ}\text{C} \rightarrow$  approx.  $-70^{\circ}\text{C}$ ). The dry-ice bath was then replaced by a cooling-bath and the reaction mixture was stirred at  $0^{\circ}\text{C}$  until TLC indicated complete conversion of the starting material (0.5–1.5 h). In most cases, successful reaction was accompanied by a color change from light yellow to orange/red. The solution was subsequently diluted by the addition of aqueous saturated  $\text{NH}_4\text{Cl}$  solution at  $0^{\circ}\text{C}$  and warmed to room temperature. The aqueous layer was extracted with  $\text{CH}_2\text{Cl}_2$  (3 $\times$ ). The combined organic phases were dried ( $\text{MgSO}_4$ ) and concentrated under reduced pressure. Purification by flash chromatography (cyclohexane/ethyl acetate) afforded the 1,5-hexadiene ( $\pm$ )-**2** as a mixture of diastereomers. The reaction proved to be very sensitive to the quality of  $n\text{-BuLi}$ .<sup>24</sup> Therefore, it was freshly titrated<sup>2</sup> and used, while it appeared as a clear, colorless solution.

**General procedure SI-F: Pd(II)-catalyzed cycloisomerization:** The Pd-catalyst (0.05–0.1 eq) was added to a solution of 1,5-hexadiene ( $\pm$ )-**2** (1 eq) in  $\text{CH}_2\text{Cl}_2$  (10 mL/mmol **2**) and the resulting mixture was stirred at the given temperature (reaction at elevated temperatures where carried out in a glass pressure-tube,<sup>28</sup> sealed with a teflon screwcap) until TLC indicated complete conversion of the starting material (2–19 h). The reaction mixture was filtered through a short silica gel-plug (eluent  $\text{CH}_2\text{Cl}_2$  or ethyl acetate) to remove the catalyst and was then concentrated under reduced pressure. Purification by flash chromatography (cyclohexane/ethyl acetate) afforded the corresponding methylene cyclopentane ( $\pm$ )-**1** along with methyl cyclopentene ( $\pm$ )-**3** as a mixture of diastereomers.

**Pd(II)-catalyzed cycloisomerization:  $^1\text{H}$  NMR kinetic experiment:** A solution of hexadiene  $(\pm)$ -**2a** (4.5 mg, 0.02 mmol, 1 eq) in  $\text{CDCl}_3$  (0.2 mL, 10 mL/mmol **2a**) was added to an oven-dried Shigemi-tube<sup>29</sup> under argon. The tube was sealed with a septum and a  $^1\text{H}$  NMR spectrum was recorded (substrate spectrum).  $[\text{Pd}(\text{MeCN})_4](\text{BF}_4)_2$  (0.05 mg, 0.001 mmol, 0.05 eq) was added and the evolution of the reaction was monitored by  $^1\text{H}$  NMR spectroscopy in intervals of 0 h, 0.5 h, 1.5 h, 2 h, 3 h, ..., up to 69 h. The degree of conversion was determined in reference to the substrate spectrum.

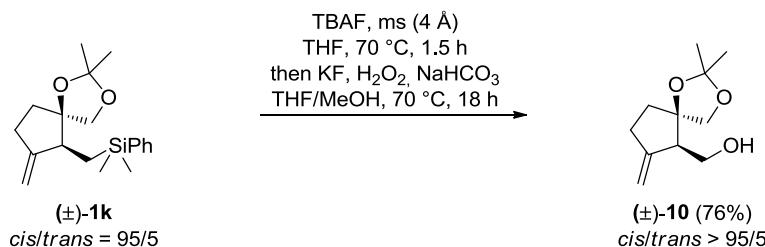

**Diol  $(\pm)$ -8:** Methylene cyclopentane **1f** (69 mg, 0.21 mmol, 1 eq) was added to a suspension of  $\text{LiAlH}_4$  (24 mg, 0.62 mmol, 3 eq) in  $\text{THF}$  (1 mL, 5 mL/mmol **1f**) at  $0\text{ }^\circ\text{C}$ . The cooling bath was removed and the reaction mixture was stirred at room temperature for a period of 1.5 h. The grey suspension was carefully diluted with ethyl acetate (5 mL) and saturated aqueous  $\text{Na}/\text{K}$  tartrate solution
