#### **Experimental Section**

NMR spectra were recorded on Bruker AM-400 (400 MHz). NMR data are reported in parts per million ( $\delta$ ) and are referenced to the deuterium lock signal from the sample solvent. EI mass spectra were obtained on an Agilent SL MSD. LCMS were run on an Agilent 1100 LCMS system. RP Preparative HPLC was carried out on Gilson semi-prep HPLC system consisting of a 215 autosampler, 322 solvent pump, 307 make-up pump, and 155 UV/VIS detector. Chiral analyses were run on either an Agilent 1100 HPLC or a Berger SFC instrument. Optical rotations were run on a JASCO DIP-370 digital polarimeter. Melting Points were measured on a Büchi B-545. HRMS was carried out on a Bruker APEX II 9.4 T mass spectrometer.

**Determination of 5-HT<sub>6</sub> Compound Intrinsic Activity using cAMP Accumulation.** Intracellular cAMP levels are measured using 24-well plates containing the human 5-HT<sub>6</sub> receptor stably transfected into HeLa cells. Upon initiation of the assay, the media from the cell maintenance is aspirated and the cells are preincubated at 37°C for 15 minutes in KREBS buffer. Following this primary incubation, the buffer is aspirated and an additional incubation is performed at 37°C for 5 minutes in KREBS buffer containing 500  $\mu$ M IBMS (3-isobutyl-1-methylxanthine). Subsequently, the cells are incubated with the test compound at concentrations ranging from 10<sup>-5</sup> to 10<sup>-10</sup> M for 10 minutes at 37°C (antagonist assay require a second incubation with the addition of 100 nM 5HT). The assay is terminated by the addition of 0.5 M perchloric acid. Intracellular cAMP levels were determined by radioimmunoassay through the cAMP SPA screening kit. Data were analyzed graphically with GraphPad Prism (GraphPad Software, San Diego, CA).

**5-HT<sub>6</sub> Membrane Preparation.** Cultured Hela cells expressing the Human cloned 5-hydroxytryptamine6 (h5-HT6) receptors are harvested and centrifuged at low speed (1,000 x g) for 5 min to remove the culture media. The harvested cells are suspended in 1 volume of fresh physiological phosphate buffered saline (PBS) solution and recentrifuged at the same speed. This operation is repeated once more. The collected cells are then homogenized in ten volumes of 50 mM Tris.HCl, pH 7.4 and 0.5 mM EDTA. The homogenate is centrifuged at 900 x g for 10 min and the supernatant collected. The supernatant is then centrifuged at 40,000g for 30 min. The pellet is resuspended in 10 volumes of Tris.HCl buffer and recentrifuged at the same speed. The final pellet is suspended in a small volume of Tris.HCl buffer and the tissue protein content is determined in aliquots of 10-25  $\mu$ L volumes. Bovine Serum Albumin is used as the standard in the protein determination by the method of Lowry et al., (*J. Biol. Chem.*, **193**, 265, 1951). The volume of the suspended cell membranes is adjusted to give a tissue protein concentration of 1.0 mg/ml of suspension. The prepared membrane suspension (10 times concentrated) is aliquoted in 1.0 ml volumes and stored at -70°C until used in subsequent binding experiments.

**5-HT<sub>6</sub> Binding Assay.** Total Bound well: Containing 80  $\mu$ L binding buffer, 20  $\mu$ L of 3  $\mu$ M [<sup>3</sup>H]-LSD, 100  $\mu$ L membrane protein (20-50  $\mu$ g protein). Total volume = 200  $\mu$ L.

Non Specific Well: Containing 60  $\mu$ L of buffer, 20  $\mu$ L of 1  $\mu$ M cold LSD, 20  $\mu$ L of 3  $\mu$ M [<sup>3</sup>H]-LSD, 100  $\mu$ L of membrane protein (20-50  $\mu$ g protein). Total volume = 200  $\mu$ L.

Compound Well: Containing 60  $\mu$ L of buffer, 20  $\mu$ L of test compound at different concentrations, 20  $\mu$ L of 3  $\mu$ M [<sup>3</sup>H]-LSD, 100  $\mu$ L of membrane protein (20-50  $\mu$ g protein). Total volume = 200  $\mu$ L.

Incubate at room temperature for 2 hours and harvest reaction mixture by using Packard 96 well harvest system followed by counting the plate in Top Count machine (Packard).

**(R)-3-(1-Methyl-pyrrolidin-2-ylmethyl)-1H-indol-5-ylamine [(R)-12].** Prepared via literature procedure.<sup>20</sup> Enantiomeric purity 99.6% by chiral HPLC. Column: Chiralpak AD 250 x 4.6 mm; mobile phase: 90/10 heptane/ethanol; flow rate: 1 mL/min; injection: 1  $\mu$ L, 1 mg/mL in ethanol; temperature 40°C; detection: UV 215 nm.  $[\alpha]^{25} = +57^\circ$  (MeOH,  $c = 1.0$ ).

**(S)-3-(1-Methyl-pyrrolidin-2-ylmethyl)-1H-indol-5-ylamine [(S)-12].** Prepared and purified as for the *R*-enantiomer. Enantiomeric purity 97.2% by chiral HPLC (conditions as (R)-12).  $[\alpha]^{25} = -49^\circ$  (MeOH,  $c = 0.9$ ).

**(R)-N-[3-(1-Methyl-pyrrolidin-2-ylmethyl)-1H-indol-5-yl]-arylsulfonamide Array [(R)-13a-w].** A solution of (R)-12 in THF (20 M) was distributed to 8 mL vials (20 mmol, 1.0 mL per vial). To each vial was added triethylamine (40 mmol, 2.0 equiv) and a sulfonyl chloride (20 mmol). The resulting reactions were shaken on an orbital shaker for 4 – 8 h. When the sulfonylation reaction was judged to be complete by TLC or LCMS the solvent was removed under a N<sub>2</sub> stream. The residues were dissolved in a mixture of DMSO/methanol/water and purified by reverse phase HPLC.

**(S)-N-[3-(1-Methyl-pyrrolidin-2-ylmethyl)-1H-indol-5-yl]-arylsulfonamide Array [(S)-13a-w].** The array was prepared as described for the *R*-enantiomers starting from (S)-12.

When the sulfonylation reaction was judged to be complete by TLC or LCMS 4N HCl in dioxane (1 mL) was added. The mixture was shaken overnight then the solvent was removed under N<sub>2</sub> stream. The residues were dissolved in a mixture of DMSO/methanol/water and purified by reverse phase HPLC.

**(R)-2-Chloro-N-(3-{{1-methyl-2-pyrrolidinyl}methyl}-1H-indol-5-yl)benzenesulfonamide [(R)-15c].**

To a solution of **(R)-14** (100 mg, 0.32 mmol) and triethylamine (88  $\mu$ L) in THF (2 mL) was added 2-chlorobenzenesulfonyl chloride (67 mg, 0.32 mmol). The reaction was stirred at r.t. for 1-2 hours then 4 N HCl (1 mL) was added and stirring at r.t. continued for 16 hours. The reaction was concentrated and the residue purified by flash chromatography on silica gel with 15% methanol (containing 10% ammonium hydroxide) in DCM to give **(R)-15c** as a tan solid (93 mg, 75 %);  $^1$ H NMR (DMSO-d6)  $\delta$  10.85 (s, 1H), 7.89 (dd,  $J$  = 8, 4 Hz, 1H), 7.64-7.50 (m, 2H), 7.39 (t,  $J$  = 4 Hz, 1H), 7.21-7.18 (m, 3H), 6.85 (dd,  $J$  = 8, 4 Hz, 1H), 5.32 (brs, 1H), 3.27-3.18 (m, 1H), 3.02-2.93 (m, 1H), 2.79 (dd,  $J$  = 14, 6 Hz, 2H), 2.64 (dd,  $J$  = 14, 8, Hz, 1H), 1.79-1.50 (m, 2H); LRMS  $m/z$ : 389.9 (M+H) $^+$ ; Anal.
