**General Methods.** All the solvents were distilled from an appropriate drying agent and stored under nitrogen atmosphere. The crude products were purified by column chromatography on silica gel of 230-400 mesh (flash chromatography). Thin-layer chromatograms were performed on HF₆₅ silica gel plates (using CH₂Cl₂, hexane/EtOAc or CH₂Cl₂/hexane as the eluents, as indicated after the Rₜ values). NMR spectra were recorded in CDCl₃ at 200, 300 MHz or 400 MHz for 1H, 50.3, 75.4 or 100.6 MHz for 13C. Chemical shifts are given in ppm with respect to internal TMS. Infrared spectra were measured on NaCl plates (neat) or in KBr; only the most significant absorptions, in cm⁻¹, are indicated. Optical rotations were measured at 20 ± 2 °C. (S)-Oct-1-yne-3-ol is commercially available. Enantioenriched compounds (S)-8 and (S)-9 could be obtained from enzymatic resolution of racemic oct-1-en-3-ol according to a literature procedure¹ or from (S)-oct-1-yne-3-ol by standard procedures.

**(S,S)-Bis(1-pentylprop-2-ynyloxy)diphenylsilane (10),** (S)-Oct-1-yn-3-ol [(S)-4] (0.5 g, 4.96 mmol) was dissolved in anhyd CH₂Cl₂ (10 mL) at 0 °C under N₂ atmosphere. Then, diphenylidiclorosilane (379 μL, 1.94 mmol) and 2,6-dimethylpyridine (847 μL, 7.27 mmol) were added via syringe. The mixture was stirred overnight at rt. The solution was partitioned with CH₂Cl₂ and brine, the organic layer was dried over anhyd MgSO₄. The crude residue was purified by flash chromatography (95:5 hexane/EtOAc) to give 10 (676 mg, 85%) as colorless oil: Rₜ = 0.65 (95:5 hexane/EtOAc); [φ]₀ −38.6 (c 1.1, CHCl₃); IR (film) 3311, 3072, 2110, 1594, 1084; ¹H NMR (CDCl₃, 400 MHz) [α] 0.84-0.88 (t, J = 6.6, 6H), 1.22-1.28 (m, 8H), 1.43-1.45 (m, 4H), 1.70-1.78 (m, 4H), 2.37 (d, J = 2.1, 2H), 4.64 (td, J = 6.4, 2.1, 2H), 7.34-7.43 (m, 6H), 7.70-7.72 (m, 4H); ¹³C NMR (CDCl₃, 50.3 MHz) [β] 14.0, 22.6, 24.5, 31.4, 38.1, 63.4, 72.5, 84.6, 127.5, 130.3, 132.4, 135.1; HRMS (FAB+) calcd for C₂₅H₂₆O₂Si [M+H]+ 433.2563, found 433.2542; Anal. Calcd for C₂₅H₂₆O₂Si: C, 77.73; H, 8.39. Found C, 77.41; H 8.49.

**(S,S)-Bis(1-pentylprop-2-enyloxy)diphenylsilane (11).** Quinoline (25 μL, 0.21 mmol) and Pd/CaCO₃ (5% Pd, 91 mg, 0.043 mmol) were added to a solution of silane 10 (575 mg, 1.33 mmol) in EtOAc (10 mL) under nitrogen. H₂ was bubbled through the mixture for a few minutes. Then, the mixture was kept under H₂ pressure (1 atm) and shaken vigourously for 4 hours. The mixture was filtered through a small pad of Celite®. Additional EtOAc was added to wash the pad. The solvent was evaporated in vacuo and

Ireland-Claisen rearrangement of (S,S)-13 in THF. A toluene solution of KHMDS (0.5 M, 1.74 mL, 0.87 mmol) was added dropwise to a solution of (S,S)-13 (100 mg, 0.29 mmol), TBDMSCl (177 mg, 1.17 mmol) and anhyd THF (3 mL) in a flask sealed with a septum, at −78 ºC under argon. After the addition, the mixture was stirred 45 min and then was allowed warm to rt overnight. Then, most of the volatiles were removed under vacuum, anhyd toluene (3 mL) was added and the mixture was heated (130 ºC bath temperature) for 12 h. The reaction mixture was partitioned by adding diethyl ether (8 mL) and brine (8 mL). The aqueous layer was washed with additional diethyl ether and the combined organic layers were dried (MgSO₄), and concentrated in vacuum. The residue was filtered through a pad of silica gel (65:35 hexane/ EtOAc) and the crude mixture was treated with THF (2 mL) and aq. LiOH (6 M, 1 mL) at 70 ºC for 14 h. Then, the solution was acidified with aq HCl (2 M, 6 mL), additional THF (3 mL) was added and the mixture was heated at 50 ºC for 3 h. The mixture was partitioned by adding CH₂Cl₂ (10 mL), and the aqueous layer was washed with additional CH₂Cl₂ (10 mL). The organic layers were dried (MgSO₄). Evaporation of solvents and purification by flash chromatography on silica gel gave (9:1 hexane/EtOAc) yielded lactone (3R,4S,5S)-7 (32 mg, 41%) and lactone (3S,4S,5S)-7 (16 mg, 21%).
