General. Infrared (IR) spectra were recorded on a Shimadzu FT-IR 8100A spectrometer. \(^1\)H and \(^1^3\)C NMR spectra were measured on a Varian Gemini-200 (200 MHz), Gemini-300 (300 MHz) and JEOL JNM-FX400 (400 MHz) spectrometers. All experiments were carried out under an atmosphere of dry argon. For thin layer chromatography (TLC) analysis throughout this work, Merck precoated TLC plates (silica gel 60 GF\(_{254}\), 0.25 mm) were used. The products were purified by preparative column chromatography on silica gel (E. Merck 9385). Microanalyses were accomplished at the Center for Instrumental Analysis, Hokkaido University and the Center of Elemental Analysis, School of Pharmaceutical Sciences, Kyoto University. The high-resolution mass spectra (HRMS) were conducted at the School of Agriculture, Hokkaido University and the School of Engineering, Kyoto University. In experiments requiring dry solvents, ether and tetrahydrofuran (THF) were purchased from Kanto Chemical Co., Ltd. as "Dehydrated". Hexane was dried over sodium metal. Methylene chloride was stored over 4Å molecular sieves. Pyridine was stored over KOH pellets. DMF and \(N,N,N',N'\)-tetramethylethylenediamine were distilled and stored over 4Å molecular sieves. Trimethylaluminum was kindly supplied by Tosoh-Finechem. Co. Ltd., Japan. Benzaldehyde and cyclohexanecarboxaldehyde were distilled under reduced pressure. Other simple chemicals were purchased and used as such.

Representative Synthetic Scheme for the Preparation of 2,7-Disubstituted-1,8-biphenylenediols. \(N\)-Pivaloyl-\(m\)-anisidine (3).\(^1\) To a solution of \(m\)-anisidine (11.2 mL, 100 mmol), pyridine (16.2 mL, 200 mmol) and 4-(dimethylamino)pyridine (122 mg, 1 mmol) in dry CH\(_2\)Cl\(_2\) (200 mL) was added pivaloyl chloride (13.5 mL, 110 mmol) dropwise at 0 °C. The resulting
mixture was stirred for 1 h at that temperature, and poured into ice-cooled 1 N HCl. The organic layer was separated and the aqueous phase was extracted with ether. The combined organic extracts were washed with 1 N HCl and brine, and dried over Na₂SO₄. Evaporation of solvents and purification of the residue by column chromatography on silica gel (EtOAc/CH₂Cl₂/hexane = 1:9:10 as eluant) gave N-pivaloyl-m-anisidine (3, 20.7 g, 100 mmol, quantitative yield) as a white solid: ¹H NMR (300 MHz, CDCl₃) δ 7.39 (1H, dd, J = 1.8, 2.4 Hz, Ar-H), 7.30 (1H, br s, N-H), 7.21 (1H, dd, J = 7.8, 8.1 Hz, Ar-H), 6.93 (1H, ddd, J = 0.6, 1.8, 7.8 Hz, Ar-H), 6.66 (1H, ddd, J = 0.6, 2.4, 8.1 Hz, Ar-H), 3.81 (3H, s, OCH₃), 1.32 (9H, s, t-Bu); IR (KBr) 3315, 2970, 1643, 1609, 1531, 1450, 1425, 1367, 1298, 1281, 1121, 1182, 1153, 1036, 959, 853, 789, 689 cm⁻¹. 2-Bromo-N-pivaloyl-m-anisidine (4).² To a solution of N-pivaloyl-m-anisidine (3, 24.9 g, 120 mmol) in dry THF (250 mL) was added a 1.6 M hexane solution of BuLi (157.5 mL, 252 mmol) dropwise over 15 min at 0 °C. After 12 h of stirring at 0 °C, the solution was cooled to −78 °C and 1,2-dibromoethane (12.4 mL, 144 mmol) was added dropwise. Then, the resulting mixture was allowed to warm to room temperature. When the generation of ethylene gas was ceased, the reaction should be completed. The solution was poured into ice-cooled 1 N HCl and the organic layer was separated. The aqueous layer was extracted with ether and the combined organic extracts were washed with brine, and dried over Na₂SO₄. The solvents were evaporated and the residual oil was treated with hexane until white solid was precipitated, which is unreacted starting material. The solid was filtered off and washed with hexane, and the filtrate was concentrated. Purification of the residue by column chromatography on silica gel (CH₂Cl₂/hexane = 1:1 as eluant) gave 2-bromo-N-pivaloyl-m-anisidine (4, 31.1 g, 108.5 mmol, 90% yield) as an yellow oil: ¹H NMR (300 MHz, CDCl₃) δ 8.15 (1H, br s, N-H), 8.07 (1H, dd, J = 1.3, 8.3 Hz, Ar-H), 7.27 (1H, dd, J = 8.3, 8.3 Hz, Ar-H), 6.64 (1H, dd, J = 1.3, 8.3 Hz, Ar-H), 3.89 (3H, s, OCH₃), 1.36 (9H, s, t-Bu); IR (liquid film) 3416, 2963, 2872, 1693, 1597, 1526, 1472, 1412, 1366, 1294, 1263, 1180, 1161, 1078, 1032, 947, 775 cm⁻¹. The dark-brown mixture was cooled to 0 °C, and neutralized by the addition of cold aqueous NaOH. The mixture was then extracted with ether and the organic extracts were washed with saturated Na\textsubscript{2}SO\textsubscript{3}, and dried over Na\textsubscript{2}SO\textsubscript{4}. To a solution of crude 2-bromo-\textit{m}-anisidine (5, ca. 20.2 g, 100 mmol) in \textit{conc.} HCl (100 mL) was added NaNO\textsubscript{2} (8.3 g, 120 mmol) dissolved in water (10 mL) dropwise at 0 °C followed by the addition of a solution of KI (49.8 g, 300 mmol) in water at that temperature. After the addition was completed, the whole mixture was heated to 80 °C and stirred there for 2 h. The resulting mixture was cooled to 0 °C and neutralized by aqueous NaOH, then extracted with ether. The combined organic extracts were dried over Na\textsubscript{2}SO\textsubscript{4}. To this solution was added a 0.5 M THF solution of ZnCl\(_2\) (12 mL, 6.0 mmol) dropwise at that temperature. After 30 min, anhydrous CuCl\(_2\) (2.2 g, 16.4 mmol, dried by heat under reduced pressure before use) was added in one portion and the resulting mixture was allowed to warm to room temperature, and vigorously stirred overnight. The reaction was quenched with 1 N HCl and extracted with ether. The combined stirred extracts were washed with brine and dried over Na\(_2\)SO\(_4\). **General Method for Nickel–Catalyzed Coupling of 9 with Grignard Reagents.** To a mixture of 9 (370 mg, 1 mmol) and NiCl\(_2\)(dppe) (26 mg, 0.05 mmol, 5 mol%) in dry ether (5 mL) was added the requisite Grignard reagent (ca. 3 equiv) at 0 °C. The whole mixture was degassed and heated to reflux until the starting material was consumed. The reaction mixture was diluted with ether

Removal of solvents and purification of the residue by column chromatography on silica gel (CH2Cl2/hexane as eluant) afforded the coupling product 10 in almost quantitative yield. Subsequent demethylation with BBr3 (2.2 equiv) in CH2Cl2 at 0 °C gave the corresponding 2,7-disubstituted-1,8-biphenylenediol 1 in good to moderate yields.

**Preparation of 3,5-Di-tert-butylphenyl Magnesium Bromide.** Mg turnings (87 mg, 3.6 mmol) were vigorously stirred and dry THF (1.5 mL) was added to the flask. Then 1,2-dibromoethane (310 \(\mu\)L, 3.6 mmol) was added dropwise with reflux to generate anhydrous MgBr\(_2\). In the meantime, 3,5-di-tert-butylbromobenzene (808 mg, 3 mmol)\(^7\) was lithiated by the treatment with a 1.6 M hexane solution of BuLi (1.88 mL, 3 mmol) in THF (3 mL) at \(-78^\circ\)C for 30 min and transferred to the solution of anhydrous MgBr\(_2\) prepared above at \(-78^\circ\)C. The resulting mixture was allowed to warm to 0 \(^\circ\)C and stirred there for 1 h to give a THF solution of the title compound.

Excess of dry hexane was added very carefully onto the layer of the CH₂Cl₂ solution of bis-Al dimer. The biphasic mixture was stood as such at room temperature. Slow diffusion of the solvents over a day gave a single crystal of colorless prism, which was mounted on a glass capillary. Data of X-ray diffraction were collected by a Rigaku RAXIS-RAPID Imaging Plate two-dimensional area detector using graphite-monochromated MoKα radiation (λ = 0.71069 Å) to a maximam 2θ value of 55°. All of the crystallographic calculations were performed using teXsan software package of the Molecular Structure Corp. The crystal structure was solved by the direct methods and refined by the full-matrix least squares using SIR-92. All non-hydrogen atoms and hydrogen atoms were refined anisotropically and isotropically, respectively. The crystallographic data were summarized in the following table.

**General Procedure for the Reduction of Acetophenone with Bis(organoaluminum)**

**Reagents 2.** A suspension of 2,7-dimethyl-1,8-biphenylenediol (1a, 117 mg, 0.55 mmol) in dry CH₂Cl₂ (5 mL) was degassed carefully with stirring, and a 1 M hexane solution of Me₃Al (1.1 mL,
1.1 mmol) was added at room temperature. Evolution of methane gas was observed and the mixture turned into wine-red as suspended biphenylenediol was completely dissolved. After 30 min, the solution was cooled to -78 °C. Acetophenone (58 μL, 0.5 mmol) was added followed by the addition of Bu₃SnH (148 μL, 0.55 mmol) at -78 °C. The reaction mixture was stirred for 5 h at that temperature and quenched with 1 N HCl. Usual workup and purification by silica gel column chromatography (CH₂Cl₂ as eluant) gave 2-phenethyl alcohol (55 mg, 0.45 mmol, 91% yield) as a colorless oil: ¹H NMR (300 MHz, CDCl₃) δ 7.40-7.26 (5H, m, Ph), 4.91 (1H, dq, J = 3.6, 6.3 Hz, O-CH), 1.79 (1H, d, J = 3.6 Hz, OH), 1.51 (3H, d, J = 6.3 Hz, CH₃). 2,7-Dimethyl-1,8-biphenylenediol was easily recovered quantitatively by the elution with CH₂Cl₂/ether = 19:1 to 9:1.

**Reduction of 5-Nonanone.** A solution of bis(organoaluminium) reagent 2a (0.55 mmol) in CH₂Cl₂ (5 mL) was prepared in a similar manner as described above, and 5-nonanone (86 μL, 0.5 mmol) was added dropwise followed by the addition of Bu₃SnH (148 μL, 0.55 mmol) at -78 °C. The reaction was completed within 20 min. The mixture was poured into ice-cooled 1 N HCl and extracted with ether. The ethereal extracts were washed with brine and dried over Na₂SO₄. Evaporation of solvents and purification of the residue by column chromatography on silica gel (CH₂Cl₂ as eluant) gave 5-nonanol (62 mg, 0.43 mmol, 86% yield) as a colorless oil: ¹H NMR (300 MHz, CDCl₃) δ 3.59 (1H, m, O-CH), 1.50-1.25 (13H, m, CH₃(CH₂)₃CHOH), 0.91 (6H, t, J = 7.2 Hz, CH₃).

**Mukaiyama Aldol Reaction.** Benzaldehyde (51 μL, 0.5 mmol) was added to a solution of in situ prepared 2a (0.55 mmol) in CH₂Cl₂ (5 mL) at -78 °C followed by the addition of 1-(trimethylsiloxy)-1-cyclohexene (107 μL, 0.55 mmol). The reaction was monitored by TLC analysis and completion was confirmed after 3.5 h. The whole mixture was poured into 1 N HCl and extracted with ether. The ethereal extracts were washed with saturated NaHCO₃ and brine, and dried over Na₂SO₄. The solvents were removed by evaporation and the residue was purified by column chromatography on silica gel (CH₂Cl₂/hexane = 1:2 to CH₂Cl₂ as eluant) to give the corresponding aldol product, 2-(1'-trimethylsiloxybenzyl)-1-cyclohexanone [12 (R = SiMe₃)]⁸ (121 mg, 0.44 mmol, 87% yield, erythro/threo = 1:3): ¹H NMR (300 MHz, CDCl₃) erythro isomer: 7.39-7.15 (5H, m, Ph), 5.54 (1H, d, J = 5.2 Hz, O-CH), 2.60-1.15 (9H, m, CH and CH₂), 0.21 (9H, s, Si(CH₃)₃); threo isomer: 7.40-7.20 (5H, m, Ph), 5.28 (1H, d, J = 8.1 Hz, O-CH), 2.80-1.15 (9H, m, CH and CH₂), 0.20 (9H, s, Si(CH₃)₃).
Mukaiyama Michael Addition. Ketene silyl acetal 13\(^9\) (96 mg, 0.55 mmol) was added to a solution of the complex of benzalacetone (73 mg, 0.5 mmol) with 2a (0.55 mmol) in CH\(_2\)Cl\(_2\) (5 mL) at -78 °C. The mixture was stirred for 15 min at that temperature and then poured into 1 N HCl. Extractive workup was carried out with ether and the combined extracts were dried over Na\(_2\)SO\(_4\). Evaporation of solvents and purification of the residue by column chromatography on silica gel afforded 1,4-adduct 15 and 16 in the form of enol silyl ether (117 mg, 0.36 mmol, 73% combined yield) with silyl ether of 1,2-adduct 17 (12.3 mg, 0.038 mmol, 8% yield): \(^1\)H NMR (300 MHz, CDCl\(_3\)) 1,4-adduct 15 (Z-isomer): \(\delta\) 7.27-7.13 (5H, m, Ph), 4.92 (1H, dd, \(J = 0.9, 10.5\) Hz, PhC-CH=C), 3.98 (1H, d, \(J = 10.5\) Hz, PhCH), 3.58 (3H, s, CO\(_2\)CH\(_3\)), 1.80 (3H, d, \(J = 0.9\) Hz, -C=C-CH\(_3\)), 1.14 (6H, s, C(CH\(_3\))\(_2\)CO\(_2\)CH\(_3\)), 0.05 (9H, s, Si(CH\(_3\))\(_3\)); 1,4-adduct 16 (E-isomer): \(\delta\) 7.27-7.13 (5H, m, Ph), 5.14 (1H, dd, \(J = 0.9, 10.5\) Hz, PhC-CH=C), 3.69 (1H, d, \(J = 10.5\) Hz, PhCH), 3.61 (3H, s, CO\(_2\)CH\(_3\)), 1.69 (3H, d, \(J = 0.9\) Hz, C=CCH\(_3\)), 1.10 (6H, s, C(CH\(_3\))\(_2\)CO\(_2\)CH\(_3\)), 0.19 (9H, s, Si(CH\(_3\))\(_3\)); IR (liquid film, Z/E = 41:59 mixture) 2953, 1736, 1666, 1470, 1452, 1433, 1387, 1366, 1254, 1190, 1128, 1032, 1011, 986, 905, 847, 752, 704 cm\(^{-1}\).
