Cross-Coupling Reactions of Alkenylsilanols with Fluoroalkylsulfonates

Scott E. Denmark* and Ramzi F. Sweis

Roger Adams Laboratory, Department of Chemistry, University of Illinois, Urbana, Illinois, 61801

SUPPORTING INFORMATION

General Experimental

All reactions were performed in oven (180 °C) and/or flame dried glassware under an atmosphere of dry argon. All reaction temperatures corresponded to internal temperatures unless otherwise noted. All the solvents used were technical grade and distilled from the indicated drying agents: dichloromethane: P2O5; diethyl ether and tetrahydrofuran: Na, benzophenone; pentane, hexane, dimethylformamide, and dimethoxyethane: CaH2; methanol: Mg(OMe)2; ethyl acetate: K2CO3. “Brine” refers to a saturated solution of NaCl. Bulb-to-bulb distillations were performed on a Büchi GKR-50 Kugelrohr and boiling points (bp) correspond to the uncorrected, recorded air bath temperatures (ABT). All reaction temperatures correspond to internal temperatures measured with Teflon-coated thermocouples unless otherwise noted.

1H and 13C NMR were recorded on a Varian Unity-500 (500 MHz 1H, 126 MHz 13C) and Varian Unity Inova 500 (500 MHz 1H, 100 MHz 29Si) spectrometer in deuterochloroform unless otherwise stated using chloroform as an internal reference (7.26 ppm, 1H; 77.2 ppm, 13C). Chemical shifts are reported in ppm (d); multiplicities are indicated by s (singlet), d (doublet), q (quartet), qn (quintet), sext (sextet), m (multiplet), and br (broad). Coupling constants, J, are reported in Hertz (Hz); integration is provided; and assignments are indicated.

Mass spectrometry was performed by the University of Illinois Mass Spectrometer Center. Electron impact (EI) spectra were performed on a Finnigan-MAT CH-5 spectrometer. Data are reported in the form of m/z (intensity relative to the base peak = 100). Infrared spectra (IR) were recorded on a Mattson Galaxy 5020 spectrophotometer. Peaks are reported in cm⁻¹ with the indicated relative intensities: s (strong, 67-100%); m (medium, 34-66%); w (weak, 0-33%). Elemental analyses were performed by the University of Illinois Microanalytical Service Laboratory.
Analytical thin layer chromatography was performed on Merck Reverse-Phase C18 silica gel plates (RP C18) with F-254 indicator or Merck silica gel plates with F-254 indicator. Visualization was accomplished with UV light, an aqueous KMnO$_4$ solution, or phosphomolybdic acid in ethanol. Column chromatography was performed using 230-400 mesh silica gel purchased from EM Science or 230-400 mesh C18 Reverse Phase (RP) silica gel purchased from Fluka.

Analytical gas chromatography (GC) was performed using a Hewlett Packard 5890 Series II Gas Chromatograph fitted with a flame ionization detector. Injections were made on a Hewlett-Packard HP-5 (50 meter) or a Hewlett-Packard Ultra-2 (50 meter) capillary column. The injector temperature was 225 °C, the detector temperature was 300 °C, with a split ratio of 100:1. Retention times ($t_R$) and integrated ratios were obtained using Agilent Chemstation Software.

**Literature Preparations**

(E)-Dimethyl-(1-heptenyl)silanol,\(^1\) (Z)-dimethyl-(1-heptenyl)silanol,\(^1\) phenyl triflate,\(^2\) phenyl nonaflate,\(^3\) 1-naphthyltriflate,\(^4\) 2-methylphenyl triflate,\(^5\) 4-methoxyphenyl triflate,\(^4\) 4-acetylphenyl nonaflate,\(^3,6\) and 4-t-butylcyclohex-1-enyl triflate,\(^7\) were prepared by literature methods.

**General Procedure I: Palladium-Catalyzed Cross-Coupling Reaction of (E)-1 with Phenyl Nonaflate or Phenyl Triflate.**

\]

The selected tetralkylammonium fluoride (0.4 mmol, 2.0 equiv) was dissolved in dry dioxane or DMF (325 µL or 375 µL) at room temperature in a 1 mL conical vial with a magnetic stir bar and fitted with a septum. To this solution was added the appropriate amount of water, followed by naphthalene (internal standard), di-t-butylbiphenylphosphine (BPTBP) (0.02 mmol, 0.10 equiv), the palladium bromide or palladium chloride (0.01 mmol, 0.05 equiv), (E)-1 (0.22 mmol, 1.1 equiv), and either the phenyl nonaflate of phenyl triflate (2.0 mmol, 1.0 equiv). The mixture was then purged with dry argon gas via a needle though the septum. The reaction was monitored by GC analysis at certain intervals until completion. Sampling of the reaction
was done by removing 10 µL of the mixture via syringe, and adding it to a 20% solution of 2-
dimethylaminoethanethiol hydrochloride to quench. The resultant mixture was then filtered
through a small plug of silica gel and was eluted with 4 mL of diethyl ether. This sample was
then analyzed by GC. Conversions were calculated relative to the internal standard. Response
factors were obtained by equation 1 and are shown below:

Response factor for A = \[
\frac{\text{mass A} \times \text{area naphthalene}}{\text{mass naphthalene} \times \text{area A}}
\]

General Procedure II: Palladium-Catalyzed Cross-Coupling Reaction of (E)- or (Z)-Alkenylsilanols with Aryl Triflates/Nonaflates and Alkenyl Triflates.

The selected tetralkylammonium fluoride (4.0 mmol, 2.0 equiv) was dissolved in dry dioxane or DMF (3.25 or 3.75 mL) at room temperature in a 2-necked round-bottom flask fitted to a dry argon line and fitted with a septum. To this solution was added the appropriate amount of water, followed by di-\textit{t}-butylbiphenylphosphine (BPTBP) (0.20 mmol, 0.10 equiv) and the palladium bromide (0.10 mmol, 0.05 equiv). This mixture first was stirred at room temperature for 30 min when a Z-silanol was employed. The silanol (2.2 mmol, 1.1 equiv) and either the aryl triflate, nonaflate or alkenyl triflate (2.0 mmol, 1.0 equiv) was then added to the mixture. When a Z-silanol was employed, the reaction mixture was first quenched by addition of 400 µL of a 20% solution of 2-dimethylaminoethanethiol hydrochloride. It was then filtered through a short silica gel column (20 g). The plug was eluted with diethyl ether (100 mL) and the eluate was evaporated in vacuo. The residue was purified by column chromatography (Reverse Phase C18 or SiO\textsubscript{2}, 25 g) to afford the corresponding product which was further purified by bulb-to-bulb distillation.

Preparation of (E)-1-Heptenylbenzene ((E)-2a) (Table 2, entry 1).

Following General Procedure II, a mixture of TBAF (1.26 g, 4.0 mmol, 2.0 equiv), (E)-1 (379 mg, 2.2 mmol, 1.1 equiv), phenyl triflate (452 mg, 2.0 mmol), BPTBP (60 mg, 0.2 mmol, 0.10 equiv), and PdBr\textsubscript{2} (26.6 mg, 0.10 mmol, 0.05 equiv) was stirred in dioxane (3.25 mL) and water (360 µL, 20.0 mmol, 10 equiv) at room temperature for 8 h, and then was quenched and filtered through SiO\textsubscript{2}. Purification of the residue by column chromatography (RP C18, MeOH/H\textsubscript{2}O, 9/1) and Kugelrohr distillation afforded 317 mg (91%) of (E)-2a as a colorless oil. The spectroscopic data matched those from the literature.\textsuperscript{1}
Data for (E)-2a:

bp: 160 °C (0.5 mm Hg, ABT)

$^1$H NMR: (500 MHz, CDCl$_3$)

7.35 (dt, $J = 8.4$, 1.7, 2 H, HC(2)), 7.29 (td, $J = 7.4$, 2.1, 2 H, HC(3)), 7.19 (tt, $J = 7.3$, 1.3, 1 H, HC(4)), 6.38 (d, $J = 15.7$, 1 H, HC(1')), 6.24 (dt, $J = 15.8$, 6.9, 1 H, HC(2')), 2.21 (qd, $J = 7.7$, 1.5, 2 H, HC(3')), 1.48 (m, 2 H, HC(4')), 1.34 (m, 4 H, HC(5') and HC(6')), 0.91 (t, $J = 7.2$, 3 H, HC(7'))

$^{13}$C NMR: (126 MHz, CDCl$_3$)

138.2, 131.5, 129.9, 128.7, 127.0, 126.1, 33.2, 31.6, 29.3, 22.8, 14.3

TLC: $R_f$0.25 (MeOH/H$_2$O, 9/1) [RP C18, UV]

GC: $t_R$ (E)-2a, 8.35 min (99.5%); $t_R$ (Z)-2a, 7.48 min (0.5%) (U2, 200 °C, 15 psi)

Preparation of (Z)-1-Heptenylbenzene ((Z)-2a) (Table 2, entry 2).

Following General Procedure II, a mixture of TBAF (1.26 g, 4.0 mmol, 2.0 equiv), (Z)-1 (379 mg, 2.2 mmol, 1.1 equiv), phenyl nonaflate (752 mg, 2.0 mmol), BPTBP (60 mg, 0.2 mmol, 0.10 equiv), and PdBr$_2$ (26.6 mg, 0.10 mmol, 0.05 equiv) was stirred in dioxane (3.25 mL) and water (216 µL, 12.0 mmol, 6 equiv) at room temperature for 14 h, and then was quenched and filtered through SiO$_2$. Purification of the residue by column chromatography (RP C18, MeOH/H$_2$O, 9/1) and Kugelrohr distillation afforded 306 mg (88%) of (Z)-2a as a colorless oil. The spectroscopic data matched those from the literature.$^1$

Data for (Z)-2a:

bp: 160 °C (0.5 mm Hg, ABT)

Preparation of \((Z)-1-(1-\text{Heptenyl})-4-\text{tert}-\text{butyl}-1\)-cyclohexene ((Z)-3) (Figure #3).

Following General Procedure II, a mixture of TBAF (1.26 g, 4.0 mmol, 2.0 equiv), \((Z)-1\) (379 mg, 2.2 mmol, 1.1 equiv), 4-\text{t}-\text{butylcyclohex-1-enyl triflate} (573 mg, 2.0 mmol), BPTBP (60 mg, 0.2 mmol, 0.10 equiv), and PdBr\(_2\) (26.6 mg, 0.10 mmol, 0.05 equiv) was stirred in DMF (3.25 mL) at 50 °C for 12 h, and then was quenched and filtered through SiO\(_2\). Purification of the residue by gravity column chromatography (RP C18, MeOH/H\(_2\)O, 9/1) and Kugelrohr distillation afforded 303 mg (65%) of (Z)-3 as a colorless oil. Purity was assayed at >97% by GC (small disiloxane contaminant) due to difficulty obtaining a sample with suitable microanalytical standards.

Data for (Z)-3:
- **bp:** 175 °C (0.45 mm Hg, ABT)
- **\(^1\)H NMR:** (500 MHz, CDCl\(_3\))
  
  5.75 (d, \(J=11.8, 1\) H, HC(1’)), 5.63 (m, 1 H, HC(2)), 5.26 (dt, \(J=11.8, 7.5\) 1 H, HC(2’)), 1.81-2.32 (m, 6 H, HC(3’), HC(3) and HC(6)), 1.10-1.42 (m, 9 H, HC(4’), HC(5’), HC(6’), HC(4) and HC(5)), 0.87 (m, 12 H, HC(7’) and HC(8))
- **\(^{13}\)C NMR:** (126 MHz, CDCl\(_3\))
  
  135.7, 131.3, 130.0, 127.8, 43.9, 32.4, 31.8, 30.7, 30.3, 29.9, 29.1, 27.4, 27.3, 24.5, 22.8, 14.2
- **TLC:** \(R_f\) 0.03 (RP C18, MeOH/H\(_2\)O, 9/1) [RP C18, UV]
- **IR:** (NaCl)
  
  2957 (s), 2946 (s), 1708 (m), 1631 (w), 1463 (m), 1324 (m), 1292 (w), 1078 (m), 952 (m), 720 (w)
- **MS:** (EI, 70 eV)
  
  234 (M+, 36), 219 (7), 191 (17), 177 (25), 163 (27), 149 (8), 135 (18), 121 (27), 107 (49), 93 (64), 79 (71), 67 (35), 57 (100)
HRMS: (EI)
Calcd. For (C_{17}H_{30}): 234.2348
Found: 234.2354

GC: $t_R$ (Z)-3, 8.86 min (96.6%); $t_R$ (E)-3, 9.21 min (3.4%) (HP-1, 15 psi, 100 °C (3 min), 20 °C/min to 150 °C, 150 °C (2 min), 50 °C/min to 270 °C.)
