General: All reactions were carried out under a nitrogen atmosphere in flame-dried glassware. Tris(dibenzylideneacetone)dipalladium(0) and palladium(II) acetate were purchased from Strem Chemical Co. and used without purification, and C-Phos and X-Phos were purchased from Sigma-Aldrich Co. and was used without further purification. Aryl triflates were prepared according to a procedure published by Frantz and coworkers,^[1] except the products were purified by column chromatography. Bulk quantities of lithium *tert*-butoxide and sodium *tert*-butoxide were stored in nitrogen-filled glove box and small amounts were removed shortly before use. Toluene, THF, dichloromethane and diethyl ether were purified using a GlassContour solvent purification system. Structural and stereochemical assignments were made on the basis of 2-D COSY, and NOESY experiments. Ratios of diastereomers were determined by ^1H NMR analysis. Yields refer to isolated yields of compounds estimated to be $\geq 95\%$ pure as determined by ^1H NMR analysis unless otherwise noted.

Preparation and Characterization of Substrates

Methyl *N*-benzyl-*N'*-cyanocarbamimidothioate (S1). A flame dried flask was cooled under a stream of nitrogen and charged with dimethyl cyanocarbonimidodithioate (2 g, 13.6 mmol) and ethanol (40 mL). Benzylamine (2.2 mL, 20.6 mmol) was then added via syringe, and the solution was heated to reflux with stirring for 2 h. The solution was then cooled to rt, a stream of nitrogen was blown over the solution for 20 min, and then the solution was placed in the freezer overnight. The white precipitate that had formed was then isolated via filtration using a fritted glass funnel to yield 2.61g (94%) of the desired product as a white solid. ¹H NMR (400 MHz, CDCl₃) δ 7.41–7.23 (m, 5 H), 6.60 (s, br, 1 H), 4.50 (s, br, 2 H), 2.48 (s, br, 3 H).

General Procedure A for Pd-Catalyzed Carboamination Reactions of Aryl Bromides. A flame dried Schlenk tube equipped with a magnetic stirbar was cooled under a stream of nitrogen and charged with Pd₂(dba)₃ (1 mol%), XPhos or CPhos (4 mol%), and NaO^tBu (2 equiv). The tube was purged with nitrogen and then a solution of the aryl bromide (1.5 equiv) in toluene was added, and the resulting solution was stirred at rt for 1 min. A solution of the *N*-protected guanidine substrate (1 equiv) in toluene (0.1 M) was added, and the solution was heated to 90 °C with stirring until the starting material had been consumed as judged by TLC or ¹H NMR analysis of the reaction mixture (ca 1 h). The mixture was then cooled to rt and saturated aqueous NH₄Cl (1 mL) was added. The resulting mixture was then extracted with ethyl acetate (3 x 2 mL), and the combined organic layers were filtered through a plug of silica gel. The organic layer was then concentrated *in vacuo*, and the crude product was purified via flash column chromatography on silica gel (methanol:dichloromethane = 1:99).

General Procedure B for Pd-Catalyzed Carboamination Reactions of Aryl Triflates. A flame dried Schlenk tube equipped with a magnetic stirbar was cooled under a stream of nitrogen and charged with Pd(OAc)₂ (2 mol%), CPhos (4 mol%), and LiO^tBu (2 equiv). The tube was purged with nitrogen and then a solution of the aryl triflate (1.5 equiv) in PhCF₃ was added, and the resulting solution was stirred at rt for 1 min. A solution of the *N*-protected guanidine substrate (1 equiv) in CF₃Ph (0.2 M) was added, and the solution was heated to 100 °C with stirring until the starting material had been consumed as judged by TLC or ¹H NMR analysis of the reaction mixture (ca 2 h). The mixture was then cooled to rt and saturated aqueous NH₄Cl (1 mL) was added. The resulting mixture was then extracted with ethyl acetate (3 x 2 mL), and the

combined organic layers were filtered through a plug of silica gel. The organic layer was then concentrated *in vacuo*, and the crude product was purified via flash column chromatography on silica gel (methanol:dichloromethane = 1:99).

Synthesis of deuterated substrates and products

(Z)-N-benzylprop-2-en-3-d-1-amine (S13): A flame dried flask was cooled under a stream of nitrogen and charged with *N*-benzylprop-2-en-1-ylamine (1.00 g, 6.84 mmol) and diethyl ether (12 mL). The solution was cooled to -42 °C, and then *n*-butyl lithium (8.2 mmol, 2.5 M) was added slowly. After 30 minutes *tert*-butyl lithium (15 mmol, 1.7 M) was added slowly. After stirring at -42 °C for 30 minutes the reaction was transferred to an ice-water bath and allowed to stir for 1 hour. The reaction was then cooled to -78 °C, and deuterium oxide was added (2.5 mL, 136.8 mmol). After stirring overnight the reaction was cooled on an ice-water bath, and then quenched with water (15 mL). The mixture was extracted with diethyl ether (2 x 20 mL) and separated. The combined organic layers were then dried, filtered, and evaporated. The crude

product was purified via flash column chromatography on silica gel (ethyl acetate/hexanes) to afford 0.568 g (56%) of the title compound as a pale yellow oil, with 84% deuterium incorporation as determined by ^1H NMR. ^1H NMR (400 MHz, CDCl_3) δ 7.31 (d, J = 4.5 Hz, 4 H), 7.2–7.18 (m, 1 H), 6.03–5.79 (m, 1 H), 5.22–5.15 (m, 1 H), 5.12–5.06 (m, 1 H), 3.78 (s, 3 H), 3.27 (d, 6 Hz, 2 H).

(Z)-N-benzyl-2-methylprop-2-en-3-d-1-amine (S14). A flame dried flask was cooled under a stream of nitrogen and charged with *N*-benzylbut-3-en-2-ylamine (**S5**) (1.00 g, 6.62 mmol) and diethyl ether (13 mL). The solution was cooled to $-42\text{ }^\circ\text{C}$, and then *n*-butyl lithium (7.95 mmol, 2.5 M) was added slowly. After 30 minutes *tert*-butyl lithium (14.59 mmol, 1.7 M) was added slowly. After stirring at $-42\text{ }^\circ\text{C}$ for 30 minutes the reaction was transferred to an ice-water bath and allowed to stir for 1 hour. The reaction was then cooled to $-78\text{ }^\circ\text{C}$, and deuterium oxide was added (2.4 mL, 132.4 mmol). After stirring overnight the reaction was cooled on an ice-water bath, and then quenched with water (15 mL). The mixture was extracted with diethyl ether (2 x 20 mL) and separated. The combined organic layers were then dried, filtered, and evaporated. The crude product was purified via flash column chromatography on silica gel (ethyl acetate/hexanes) to afford 0.60 g (56%) of the title compound as a pale yellow oil, with 83% deuterium incorporation as determined by ^1H NMR. ^1H NMR (CDCl_3) δ 7.39–7.28 (m, 4 H), 7.28–7.18 (m, 1 H), 4.90 (s, 1 H), 4.84 (s, 1 H), 3.76 (s, 2 H), 3.18 (s, 2 H), 1.76 (s, 3 H).
