

Supplemental Material S12. Results of linear regression model of lexical tone pitch slopes with different predictors: tone category (T1-4), age at implantation, CI experience, chronological age, and residual hearing. The predictors were entered into the model stepwise and the best model included all predictors.

Predictor	ΔR^2	<i>B</i>	<i>SE (B)</i>	β	<i>p</i>
Tone category	0.31	—	—	—	—
Age at implantation	0.15	0.001	0.002	0.022	< .01**
CI experience	0.10	0.004	0.002	0.009	< .05*
Chronological age	0.09	-0.004	0.001	-0.007	< .05*
Residual hearing	0.09	-0.005	0.003	-0.007	.091

Note. CI = cochlear implant.
