

Supplementary Figure 5. Biofilm formation of *B. cenocepacia* K56-2 WT, WT::BCAL1069 c-di-GMP mutant and complemented mutant. The graph shows biofilm formation of the strains in 96 well plates after 48 hours of incubation time. The CV stained attached cells were resuspended in acetone: ethanol (20:80) and measured at OD₆₀₀. The biofilm assay was performed three times independently with four technical replicates. 'NS' represent no significant difference.
