

Iba-1 protein expression in brain sections from rats injected with different HMGB1 redox isoforms

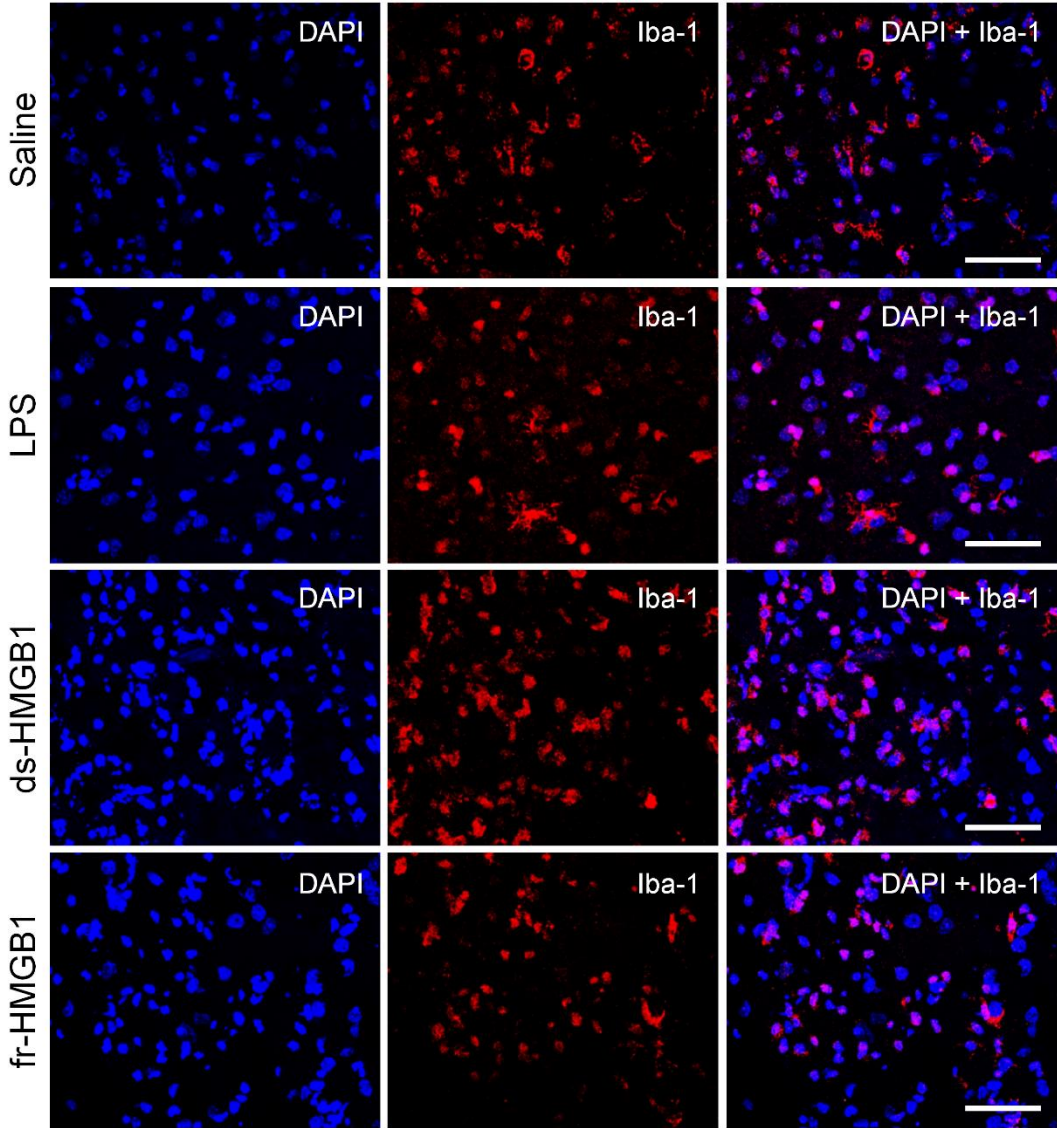

Fig S1. Detection of Iba-1⁺ microglia and macrophages at the injection site after an intracerebral injection of saline, LPS, disulfide (ds) or fully reduced (fr) HMGB1 Representative images from sections stained with an anti-Iba-1 antibody are shown. Sections were counterstained using DAPI to identify the nucleus. Scale bar = 50 μ m. (n = 3-4 rats/group).
