

Additional File 6. Table on the statistical results for the separate comparison between *C. elegans* N2 and CB4856 survival on nematocidal *B. thuringiensis*

Bacteria¹	χ^2	<i>p</i>
B-18247	4.36	0.0367
B-18679	4.6	0.0319

¹ The analysis was performed separately for each bacterium, using ordinal logistic regression, including the following factors: *C. elegans* strains (only N2 and CB4856), *B. thuringiensis* concentration, and the interaction between the two. Effect tests were performed for all factors, but the results are only shown for the *C. elegans* strain comparison (DF = 1). The factor *B. thuringiensis* always had a significant influence, while the interaction term was never significant. Significant probabilities are given in bold.
