**Abstract:** *Aloe vera* leaf contains some bioactive compounds that have a strong binding affinity toward estrogen receptor as compared to standard drug tamoxifen. In this study, we have found that the IC<sub>50</sub> of *Aloe vera* leaf extract against breast cancer cell line MCF-7 is 23 µg/mL which is much lower than the IC<sub>50</sub> (332 µg/mL) of *Aloe vera* leaf extract against non-cancerous cell line NIH-3T3. We have also calculated the total concentration of phenolic acid (385.662 µg/mL), flavonoids (160.402 µg/mL) and alkaloids (276.754 µg/mL) in *Aloe vera* leaf extract. The free radical scavenging activity of *Aloe vera* leaf extract is 67 % to 84% (at 50 to 300 µg/ml). Our virtual molecular docking study suggests that bioactive compounds like Aloe-emodin (-8.8 Kcal/mol), 7-hydroxy-2,5 dimethylchromone (-7.5 Kcal/mol), Beta-sitosterol (-7.3 Kcal/mol) etc. have a greater binding affinity toward estrogen alpha receptor as compared to standard drug Tamoxifen (-6.4 Kcal/mol).

**Keywords:** *Aloe vera*, Estrogen receptor, MTT assay, Virtual molecular docking, MCF-7

## 1. Experimental

### 1.1. Sample collection and preparation of extracts:

Fresh Aloe vera leaf was collected and identified (Scientific Name: Aloe vera (L.) Burm.f., Family: Xanthorrhoeaceae, Specimen No. RM-2310) by BOTANICAL SURVEY OF INDIA, CENTRAL NATIONAL HERBARIUM, HOWRAH – 711103. The Aloe vera whole leaf was blended using mixer grinder to extract the bioactive compounds. The freshly produced extract was filtered under vacuum pressure using Whatman Filter paper. Filtrate extract solution was lyophilized for 24 h at -80 °C. Lyophilized powder was obtained as a test sample Alo and stored at 4 °C till use.

### 1.2. Phytochemical Screening of Plant Extracts:

#### 1.2.1. *Determination of total Phenolic content*

The total phenolic content was determined by taking 20  $\mu$ L extract in 1580  $\mu$ L of distilled water. Then 100  $\mu$ L of Folin reagent (1%) was added and left to stand for 2 min. 300  $\mu$ L of  $\text{Na}_2\text{CO}_3$  (7.5%) was added and mixed thoroughly and left to stand for 2 h at 20 °C. The absorbance was measured at 650 nm with a UV-Vis spectrophotometer. All results were determined using a standard curve of gallic acid and a linear equation was used to estimate the total amount of phenols present in the extract.

#### 1.2.2. *Determination of total Flavonoid content*

The total flavonoid content (mg/mL) was determined using aluminum chloride ( $\text{AlCl}_3$ ) method. The assay mixture consisting of 0.5 mL of the plant extract, 0.5 mL distilled water, and 0.3 mL of 5%  $\text{NaNO}_2$  was incubated for 5 min at 25°C. This was followed by addition of 0.3 mL of 10%  $\text{AlCl}_3$  immediately. Two mL of 1 M  $\text{NaOH}$  was then added to the reaction mixture, and the absorbance was measured at 510 nm. All results were determined using a standard curve of quercetin and a linear equation was used to estimate the total amount of flavonoids present in the extract.

#### 1.2.3. *Determination of total Alkaloids content*

Reagent Solutions: Dragendorff's Reagent was prepared by dissolving bismuth nitrate pentahydrate (0.8044g) in 40 mL of water, 10 mL of glacial acetic acid and combined with a solution of 8.0 g of potassium iodide in 20 mL water. Ten mg bismuth nitrate pentahydrate in 5 mL concentrated nitric acid was diluted to 100 mL by adding distilled water to make a standard bismuth nitrate solution. 3.00 g of thiourea was dissolved in 100 mL of water to form a thiourea solution and a stock solution of disodium sulfide was prepared by dissolving 1.00 g of disodium sulfide in 100 mL of water.

Method: The extract solution was brought to a pH of 2.5 with dilute HCl, vortexed to dislodge the precipitation. 1.5 mL was centrifuged for 20 minutes at 13000 rpm. 0.5 mL of the supernatant was transferred to a new tube, 0.2 mL of Dragendorff's reagent was added and the tube was vortexed to dislodge any precipitate from the wall of the tube. This solution was then centrifuged for 40 minutes at 13000 rpm. The residue was dissolved in 0.2 mL concentrated nitric acid and 0.8 mL water. 0.2 mL was pipetted out and added to 1 mL of the thiourea solution. The absorbance was measured at 464 nm against a blank containing nitric acid and thiourea. All results were determined using a standard curve of 40% Bismuth nitrate pentahydrate and a linear equation was used to estimate the total amount of alkaloid present in the extract.

1.3. Quantification of Antioxidant activity using the 1, 1-diphenyl-2-picrylhydrazyl (DPPH) method:

The free radical scavenging activity (RSA) was performed using DPPH method. Different concentration of the aloe extracts (0, 50, 100, 200, 300  $\mu$ g/mL) were used. A volume of 2.5 mL of 0.04% DPPH solution was mixed with 0.5 mL of all concentrations of extracts separately. After 30 min incubation at room temperature in dark, the absorbance (abs) was taken at 517 nm in triplicates for each concentration. Citric acid was used as a standard antioxidant. Water was used as a control. The percent inhibition of free radical formation was calculated as follows

$$RSA = \frac{(Control\ abs - Sample\ abs)}{Control\ abs} \times 100$$

1.4. In-vitro antitumor activity:

1.4.1. *Cell culture*

Mouse fibroblast cell line (NIH-3T3) and human breast cancer cell line MCF-7 were collected from National Centre for Cell Science, Pune. The growth medium was prepared using Dulbecco's Modified Eagle's Medium, supplemented with 10% fetal bovine serum (Gibco) and 2% penicillin-streptomycin and maintain at 37°C in a humidified incubator with 5% CO<sub>2</sub>. The cells were grown in T-15 flasks till about 80% confluence.

#### *1.4.2. Drug and test samples treatment*

Test samples were prepared to dissolve lyophilized *Aloe vera* powder in 1% DMSO solution as a drug vehicle in various concentration. Tamoxifen (100 µg/mL) was used as a standard anticancer drug as well as anti-estrogenic drug for breast cancer treatment.

#### *1.4.3. MTT assay: Cell Viability test*

The antitumor potential of *Aloe vera* leaf extract was carried out by MTT assay on NIH-3T3 and MCF-7 cell line. Cells were seeded in 96 well plates and cultured at 37 °C for 24 h in a humidified incubator with 5% CO<sub>2</sub>. After 24 h cells were treated with *Aloe vera* test samples as well as Tamoxifen (100 µg/mL) and the cells were incubated for 37 °C for 24 h in a humidified incubator with 5% CO<sub>2</sub>. MTT (5 mg/mL in PBS) was added to the cells of each well and incubated for 3-4 h. After that, the MTT was removed and DMSO (100 µL/well) was added to dissolve the formazan crystal. Absorbance was measured at 590 nm. Later on, the percentage of cell viability was calculated.

$$\% \text{ Viable Cell} = \frac{\text{Absorbance of treated cells}}{\text{Absorbance of untreated cells}} \times 100$$

#### 1.5. Statistical Analysis:

Data are presented as mean SD. Statistical comparisons between groups were performed by Student's t-test. P< 0.05 was considered to be statistically significant.

#### 1.6. Software and Data Sources:

All the software (i.e. UCSF Chimera, Biovia Discovery Studio, Ligplot+ and PubChem Sketcher V2.4) have used for virtual screening are freely available for academic use. The source of data is given in Table S1.

*The Protein Data Bank (PDB) ([www.rcsb.org](http://www.rcsb.org))* is worldwide repository for the processing and distribution of 3D biological macromolecular structure data (Berman et al.,

2000). The protein 3D structures can be downloaded from the database with specific keywords or a PDB ID.

*The PubChem* ([pubchem.ncbi.nlm.nih.gov](http://pubchem.ncbi.nlm.nih.gov)) is a database of chemical compound structures. The database system is maintained by the National Centre for Biotechnology Information (NCBI). All the chemical compound structures in this database can be downloaded freely.

*UCSF Chimera* ([www.cgl.ucsf.edu/chimera](http://www.cgl.ucsf.edu/chimera)) is a free Graphical User Interface (GUI) to perform molecular docking experiment and result analysis. It is an extensible molecular modeling system.

*Biovia Discovery Studio 2017R2* is free academic software used for visualization of receptor-protein interaction.

*AutoDock*: The virtual screening was performed using the docking software AutoDockVina. It is an open-source program for performing molecular docking (<http://vina.scripps.edu>). AutoDock is an automated docking tool designed to predict how small molecules/ ligands such as drug candidates, bind to receptor/protein of known 3D structure.

## 1.7. Virtual Molecular Docking:

*1.7.1. Preparation of target receptor protein and determination of Active Site*: The estrogen receptor alpha structure was downloaded from RCSB PDB with code 1ERE, which has an endogenous co-crystal ligand 17-β-estradiol. The downloaded structure had six identical copies of the receptor, out of that five were removed using UCSF Chimera. After removing endogenous co-crystal ligand 17-β-estradiol and water molecules, hydrogen, Gasteiger charge was added using dock prep option of UCSF Chimera to the estrogen receptor alpha receptor protein (1ERE). The active site residues of estrogen receptor were found by using BIOVIA Discovery Studio 2017R2 software and the residues at the active site are ARG394, LEU387, LEU391, LEU525, LEU346, HIS524, GLU353 (Figure S1).

*1.7.2. Preparation of ligands:* All the ligands/chemical compounds 3D structures were built using canonical smile, obtained from PubChem and Zinc database through UCSF Chimera built structure option. Later, hydrogen, Gasteiger charge were added to using dock prep option of UCSF Chimera. The compounds thus obtained were tested for absorption, distribution, metabolism, excretion, and toxicity (ADME) on the basis of its properties like molecular weight, log p-value, number of rotatable bonds, number of hydrogen donor, number of hydrogen acceptor using SwissADME web tool.

*1.7.3. AutoDockVina running:* AutoDockVina was run using UCSF Chimera tool after the preparation of target receptor and ligands, targeting the active sites of the receptor through receptor search volume options (Center: 8.10, 46.85, 128.72. Size: 18.3, 18.85, 17.41). The other parameters were Number of binding modes: 10, Exhaustiveness of search: 8 and Maximum energy difference (Kcal/mol): 3 used in running of AutoDockVina through UCSF Chimera graphical user interface.

*1.7.4. Validation of molecular docking:* Validation was done by performing re-docking of endogenous co-crystal ligand. The root mean square deviation (RMSD) value of the co-crystal and re-dock crystal ligand was evaluated.
