### Online Appendix

Figure A1: Estimated share of supporters for more spending on different welfare components with design-based standard errors. Party families are classified according to the ParlGov-Dataset (Döring and Manow, 2020).

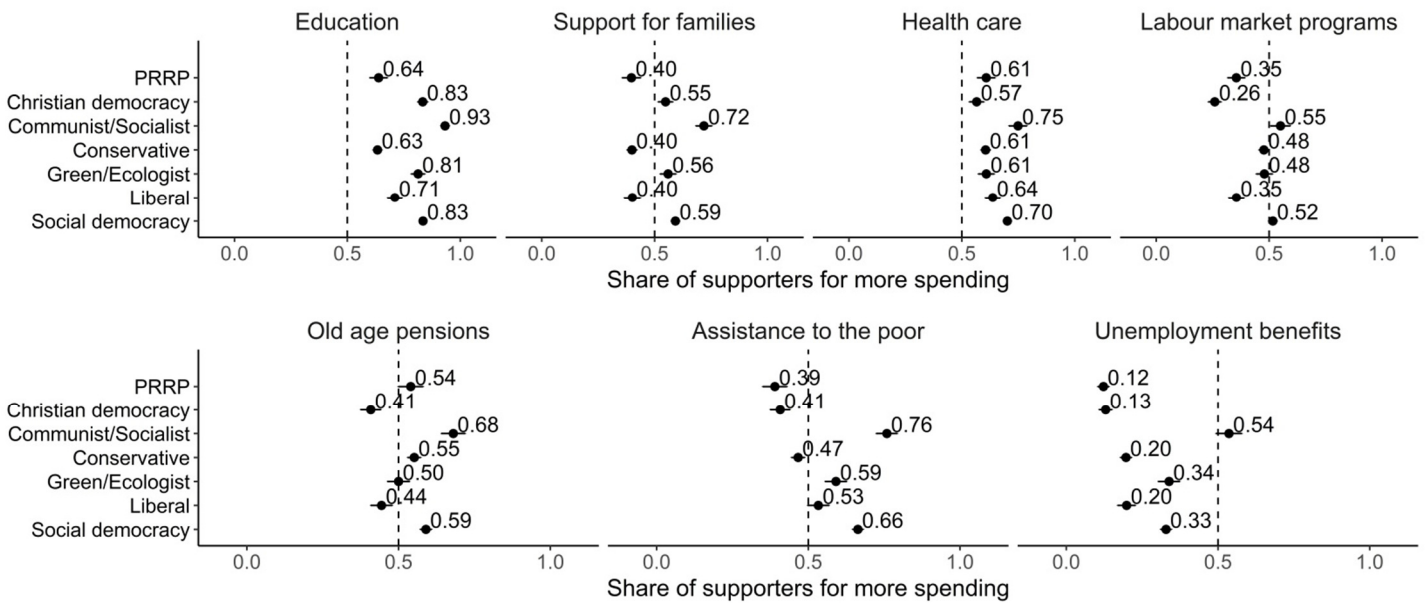

Figure A2: Regression results for welfare dimensions. Error bars indicate 95% confidence intervals based on standard errors derived from cluster-bootstrapped t-statistics. No country fixed effects are included.

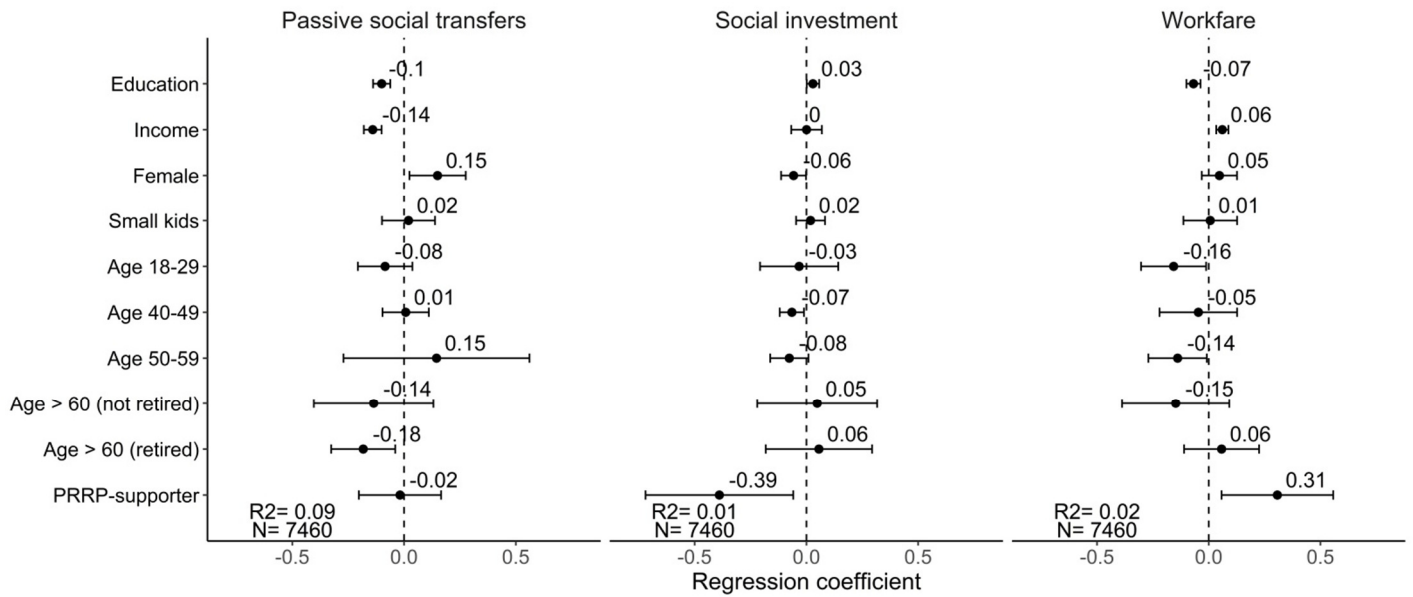

Figure A3: Regression effects of PRRP support on three latent dimensions of social policy preferences. Regressions include demographic controls and exclude one country at a time. Point estimates with 95% confidence intervals.

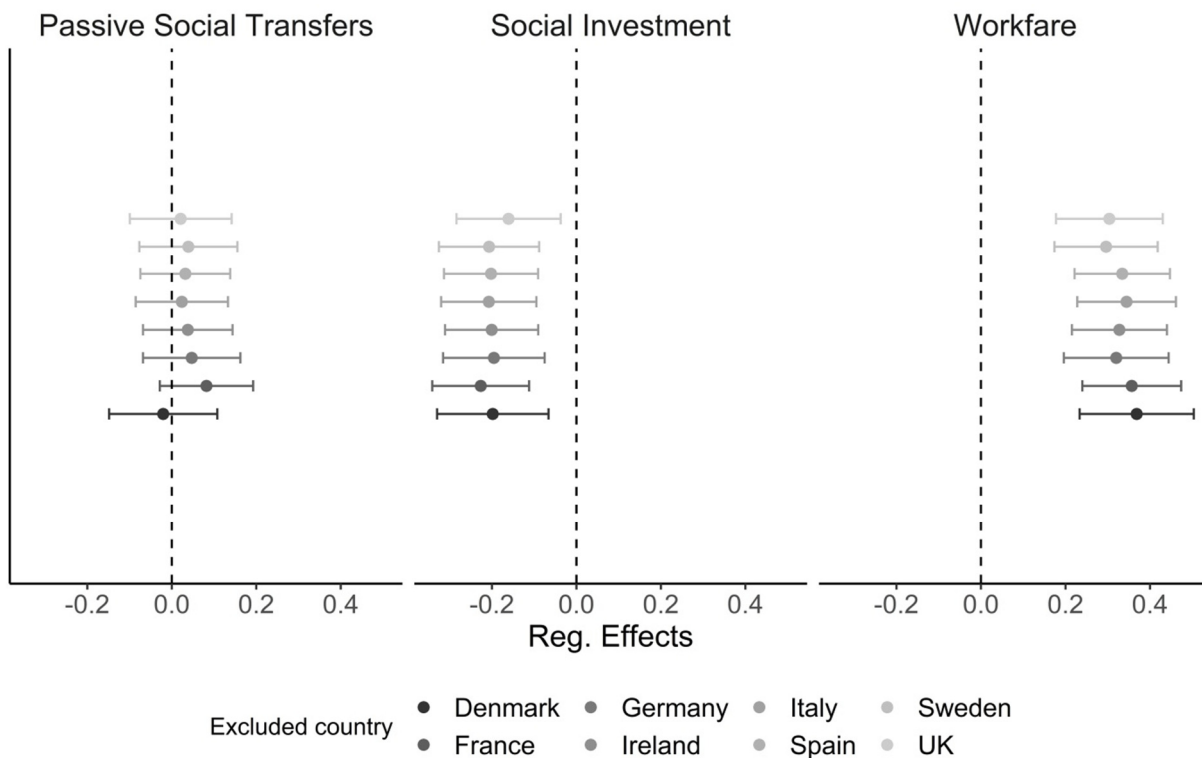

Figure A4: Regression results for welfare dimensions. Error bars indicate 95% confidence intervals derived from design-based standard errors. All models include country fixed effects.

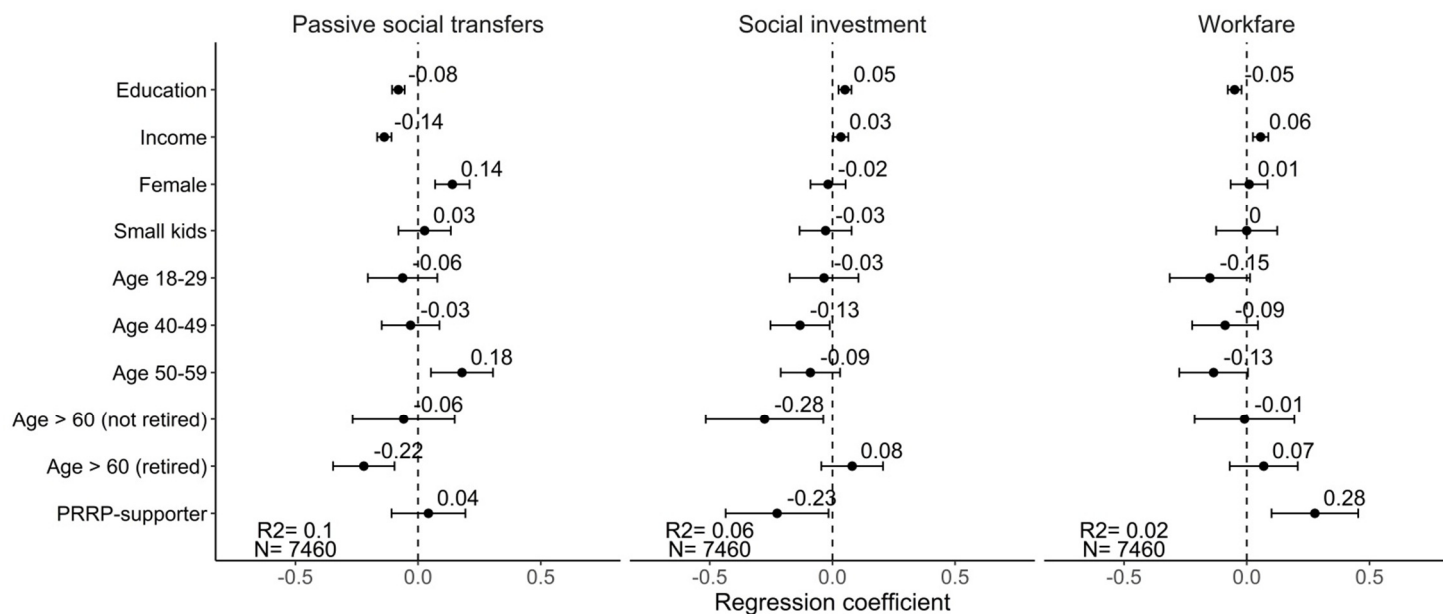

Table A1: Results for factor analysis of policy reform items. Parallel analysis, Scree test and the Eigenvalue > 1 criterion suggest three factors. Results after Varimax-rotation.
