

# Multiple sardine Operating Models and associated risk

SWG-PEL Meeting  
12<sup>th</sup> September 2018

Carryn de Moor

Marine Resource Assessment and Management Group (MARAM)  
Department of Mathematics and Applied Mathematics  
University of Cape Town

# Alternative OMs

- Alternative proportions of south component  $B^{sp}$  contributing to west component  $effB^{sp}$   
( $p=0.0, 0.08, 0.2, 0.6$ )  
NB: no impact on south recruitment anymore
- Alternative west to south movement  
(MoveR – random informed by parasite data  
MoveD – prop increases as  $B_{west}$  increases)

# Updated OM

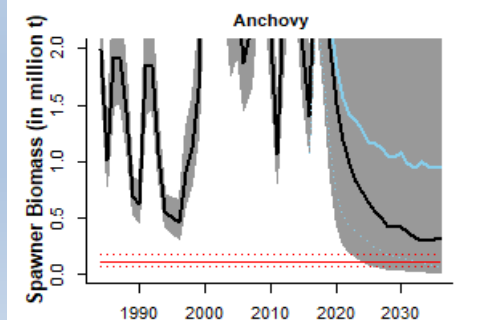

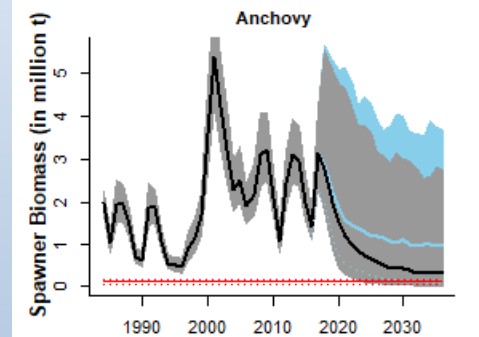

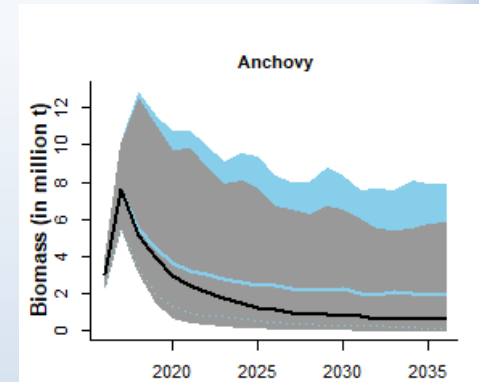

- FISHERIES/2018/SEP/SWG-PEL/27
- Final catches by area and TACs for 2017-8
- New method for simulating future south coast recruitment

# Updated CMP (“CMP1”)

- Same constraints as Interim OMP-18
- “OM1” – Same  $p=0.08$  and MoveR as Interim OMP-18
- $\text{Risk}_A$  : probability of anchovy  $B^{\text{sp}}_y$  being below  $0.25 \times B^{\text{sp}}_{2006}$  for  $y=\{2016,2036\}$
- Assume  $\text{Risk}_A=0.109$  from OMP-14 under OM1 is acceptable and tune CMP1 to  $\text{Risk}_A < 0.109$  to get  $\alpha=1.379$  (Interim OMP-18  $\alpha=0.914$ )

# Anchovy CMP1 v Interim OMP-18

- No change to No Catch
- Higher risk due to fixed catches  
(greater impact on poorer projections)
- Higher  $\alpha$ ; higher catches
- Lower  $B_{2036}$ ,  $B_{\min}$ ,  $B_{2036}/B_{2015}$
- Higher chance of CB metarule

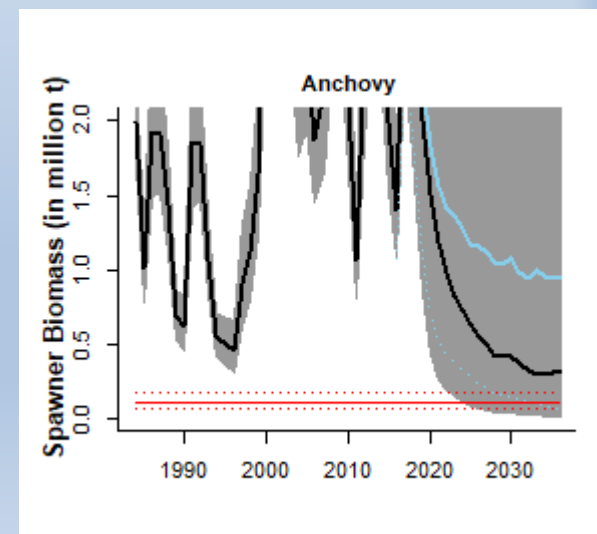

No Catch  
CMP1  
Risk threshold

# Anchovy Discussion Point?

- Is method for choosing Risk<sub>A</sub> appropriate?
- Leads to 11% chance of being below a quarter of historical low
- But this only happens after  $\pm 5$  years
- BH based on all years
  - projections more positive if BH based on 2000-15 only?
  - How long will current 'regime' last?!

No Catch  
CMP1  
Risk threshold

# Updated CMP (“CMP1”)

- Tune CMP1 to “Leftward Shift” to get  $\beta=0.174$  (with  $Risk_S=0.20$ )
  - Lower  $\beta$  due to data updates
  - Higher  $\beta$  due to south component recruitment

				Total		West Component		South Component	
		OMP-08	OMP-14	$\beta = 0.173$	$\beta = 0.174$	$\beta = 0.173$	$\beta = 0.174$	$\beta = 0.173$	$\beta = 0.174$

# Sardine Discussion Point?

- Tuning CMPs for OMP-18 has been “muddied” by changes in stock structure and risk definition
- “Equivalent” CMPs are tuned based on “Leftward shift” using total biomass
- Our concern for the resource ( $Risk_S$ ) is in terms of west  $B^{sp}$
- Is 20% chance of being below the historically lowest level acceptable?

No Catch

CMP1

Risk threshold

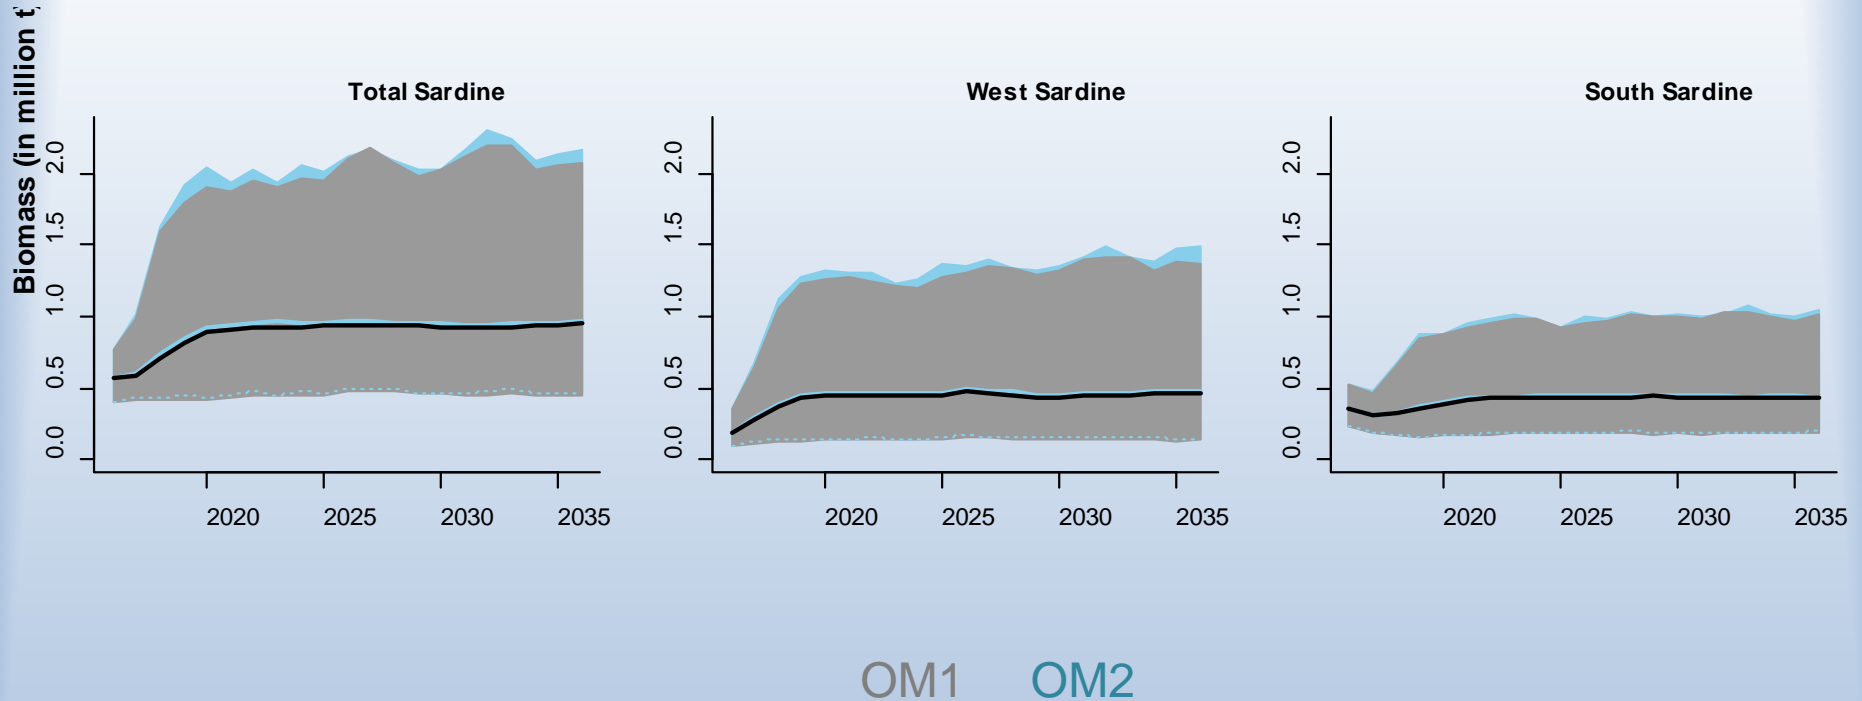

# Sardine Discussion Point?

- Do we overpredict sardine biomass (underestimate natural mortality)?
- $B_{2016}^{obs} / k_N \sim 365$  [316,426] 000t
- 80% of  $B_{2016} < 5\%$ ile of 316 00t
- $B_{2017}^{obs} / k_N \sim 473$  [409,551] 000t
- $B_{2017}$  mostly  $> 5\%$ ile of 409, median substantially below 473 000t
