

Risk Rating of Britain's Motorways and A Roads Scotland

This map shows the statistical risk of death or serious injury occurring on Britain's motorways and A road network for 2010-2012 in Scotland.

The risk is calculated by comparing the frequency of road crashes resulting in death and serious injury on every stretch of road with how much traffic each road is carrying. For example, if there are 20 crashes on a road carrying 10,000 vehicles a day, the risk is 10 times higher than if the road has the same number of collisions but carries 100,000 vehicles.

Some of the roads shown have had improvements made to them recently, but during the survey period the risk of a fatal or serious injury collision on the black road sections was 24 times higher than on the safest (green) roads.
