The DevOps Security Checklist
Culture

❑ Cover your ass

It is not a question of “if” but “when”. Evaluate your risks, prepare a proper action plan in case of a breach and communicate properly after the fact.

https://blog.serverdensity.com/how-to-write-a-postmortem/
https://codeascraft.com/2012/05/22/blameless-postmortems/
https://blog.sqreen.io/cybersecurity-risk-assessment-for-startup-cto/

❑ Follow an onboarding / offboarding checklist

This checklist should contain a list of all the steps you need to enforce when an employee, contractor, intern, etc… joins your company. A similar list can also be used when the someone is leaving your team.

https://www.rippling.com/
https://about.gitlab.com/handbook/general-onboarding/
https://about.gitlab.com/handbook/offboarding/

❑ Gamify security and train employees on a regular basis

Humans are the weakest links in the security chain. DevOps contribute to the security awareness of all the employees in a company. By explaining how an attacker could infiltrate your company, you will increase the awareness and thus minimize the chance of a hack. Don’t forget fishing and spear-fishing attacks.

https://www.schneier.com/blog/archives/2008/03/the_security_mi_1.html
Culture

SERIES BAZ

❑ Cover your ass

It is not a question of “if” but “when”. Evaluate your risks, prepare a proper action plan in case of a breach and communicate properly after the fact.

https://blog.serverdensity.com/how-to-write-a-postmortem/
https://codeascraft.com/2012/05/22/blameless-postmortems/
https://blog.sqreen.io/cybersecurity-risk-assessment-for-startup-cto/

POST SERIES B

❑ Follow an onboarding / offboarding checklist

This checklist should contain a list of all the steps you need to enforce when an employee, contractor, intern, etc… joins your company. A similar list can also be used when the someone is leaving your team.

https://www.rippling.com/
https://about.gitlab.com/handbook/general-onboarding/
https://about.gitlab.com/handbook/offboarding/

SERIES B

❑ Gamify security and train employees on a regular basis

Humans are the weakest links in the security chain. DevOps contribute to the security awareness of all the employees in a company. By explaining how an attacker could infiltrate your company, you will increase the awareness and thus minimize the chance of a hack. Don’t forget fishing and spear-fishing attacks.

https://www.schneier.com/blog/archives/2008/03/the_security_mi_1.html
SERIES A

❑ Stay on top of best practices

DevOps is an ever-changing landscape. Ensure that you stay up to date in terms of new technologies, vulnerabilities or best practices.

http://webopsweekly.com/

SERIES A

❑ Understand the risk

The cost of breaches is drastically increasing and security should be taken seriously inside an organization. DevOps engineers should play an important role in advocating for better security practices.

https://www.troyhunt.com/the-emergence-of-historical-mega-breaches/

Code

POST SERIES B

❑ Don't implement your own crypto

The problem with cryptography is, that you don't know you are wrong until you are hacked. So don't do your own crypto. Use standards instead.

https://en.wikipedia.org/wiki/Bcrypt
http://crypto.stackexchange.com/questions/43272/why-is-writing-your-own-encryption-discouraged
https://download.libsodium.org/doc/
SERIES A

- **Ensure you are using security headers**

  Modern browsers support a set of headers dedicated to block certain types of attacks. Make sure you properly implemented all security headers. Don't forget about the CSP.

  https://securityheaders.io/
  https://myheaders.sqreen.io/

SERIES B

- **Go hack yourself**

  If your company doesn’t have yet a structured security team, help create a multidisciplinary Red Team to stress your application and infrastructure. Providing an easy environment for the Red Team to attack the application should be part of the scope of DevOps.

  http://www.devsecops.org/blog/2015/12/10/red-team-pwning-the-hearts-and-minds-one-ticket-at-a-time

SERIES B

- **Integrate security scanners in your CI pipeline**

  Integrate a Dynamic Application Security Testing (DAST) tool in your CI, but just like SAST be aware of the high number of false positives.

  http://www.arachni-scanner.com/
  https://www.acunetix.com/vulnerability-scanner/

SERIES A

- **Keep your dependencies up to date**

  Third-party libraries can put your application at risk. Make sure you track your vulnerable packages and update them regularly.

  https://www.sqreen.io/
POST SERIES B

❑ **Protect your CI/CD tools like your product**

Your continuous deployment pipeline is the backbone of your IT. Security should be checked at each step. Your CI builds should fail if you detect a security vulnerability. Store your CI configuration for traceability and audit.

https://wiki.jenkins-ci.org/display/JENKINS/JobConfigHistory+Plugin
https://www.slideshare.net/kponiatowski/if-cicd-teams-have-time-for-security-so-do-you

SERIES A

❑ **Run Security tests on your code**

Static Application Security Testing (SAST) is an easy and fast way to find security vulnerabilities in your code. You can enforce SAST security checks in your CI, but be aware of the high number of false positives that can frustrate developers.

https://www.owasp.org/index.php/Source_Code_Analysis_Tools
https://github.com/mre/awesome-static-analysis
https://docs.travis-ci.com/user/coverity-scan

Infrastructure

SERIES B

❑ **Automatically configure & update your servers**

An automated configuration management tool helps you ensure that your servers are updated and secured.

**Chef:** [https://learn.chef.io/tutorials/](https://learn.chef.io/tutorials/)
**Puppet:** [https://www.digitalocean.com/community/tutorials/how-to-install-puppet-4-in-a-master-agent-setup-on-ubuntu-14-04](https://www.digitalocean.com/community/tutorials/how-to-install-puppet-4-in-a-master-agent-setup-on-ubuntu-14-04)
Ansible: http://docs.ansible.com/ansible/intro_getting_started.html
Salt: https://docs.saltstack.com/en/latest/topics/tutorials/walkthrough.html

SERIES A

❑ Backup regularly

Your data is likely to be your business’s most precious asset. Be sure not to lose it. Implement proper backups and check for backup integrity.

MongoDB Backup: https://docs.mongodb.com/manual/core/backups/
Postgresql: https://www.postgresql.org/docs/current/static/backup.html
Linux: http://www.tecmint.com/linux-system-backup-tools/

SERIES A

❑ Check your SSL / TLS configurations

Use free tools to scan your infrastructure regularly and make sure the SSL configurations are correct.

https://observatory.mozilla.org/
https://www.ssllabs.com/
https://diogomonica.com/2015/12/29/from-double-f-to-double-a/

SERIES A

❑ Control access on your cloud providers

The best way to protect your services (database, file storage) is to not use passwords at all. Use the built-in Identity and Access Management (IAM) functions to securely control access to your resources.

https://cloud.google.com/compute/docs/access/create-enable-service-accounts-for-instances
POST SERIES B

中存在的所有东西

SSL性能问题是一个神话，并且你没有任何合理的理由不使用SSL来保护你的公共服务。

https://letsencrypt.org/
https://certbot.eff.org/

POST SERIES B

加强SSH配置

SSH是Linux环境中的事实上的远程登录机制。它也是黑客的事实上的渗透向量。确保你有正确的SSH配置。

https://devops.profitbricks.com/tutorials/secure-the-ssh-server-on-ubuntu/

SERIES B

保护你的容器

使用Docker（或Kubernetes），并确保它们是修补和安全的。使用工具自动更新并扫描你的容器以检查安全漏洞。

https://www.docker.com/docker-security
https://docs.docker.com/docker-cloud/builds/image-scan/
https://jpetazzo.github.io/2015/05/27/docker-images-vulnerabilities/
https://www.slideshare.net/MichaelCherny/security-best-practices-for-kubernetes-deployment
SERIES A

❑ Log all the things

Infrastructure logs and application logs are your most precious allies for investigating a data breach. Make sure your logs are stored somewhere safe and central. Also make sure you whitelist- or blacklist-specific incoming data to avoid storing personally identifiable information (PII) data.

https://qbox.io/blog/welcome-to-the-elk-stack-elasticsearch-logstash-kibana
https://www.loggly.com/

POST SERIES B

❑ Manage secrets with dedicated tools and vaults

When you need to store cryptographic secrets (other than database password, TLS certificate, …) and perform encryption with them, you should use dedicated tools. This way the cryptographic secret never leaves the tool and you get auditing features.

https://www.vaultproject.io/
https://github.com/square/keywhiz
https://aws.amazon.com/cloudhsm/
https://aws.amazon.com/kms/

SERIES B

❑ Store encrypted passwords in your configuration management

Storing passwords (like databases ones) can be done on a dedicated database with restricted access. An other solution is to store them encrypted in your Source Code Management (SCM) system. That way, you just need the master key to decrypt them.

Chef: https://github.com/chef/chef-vault
Puppet: https://puppet.com/blog/encrypt-your-data-using-hiera-eyaml
Salt: https://docs.saltstack.com/en/latest/ref/renderers/all/salt.renderers.gpg.html
Ansible: http://docs.ansible.com/ansible/playbooks_vault.html
SERIES A

- **Upgrade your servers regularly**

  Server packages and libraries are often updated when security vulnerabilities are found. You should update them as soon as a security vulnerability is found.

  https://www.ubuntu.com/usn/
  https://help.ubuntu.com/community/AutomaticSecurityUpdates
  https://access.redhat.com/security/vulnerabilities

POST SERIES B

- **Use an immutable infrastructure**

  Use immutable infrastructures to avoid having to manage and update your servers.

  https://martinfowler.com/bliki/ImmutableServer.html
  https://hackernoon.com/configuration-management-is-an-antipattern-e677e34be64c#.n68b1i3eo

**Protection**

SERIES A

- **Don’t store credit card information (if you don’t need to)**

  Use third-party services to store credit card information to avoid having to manage and protect them.

  https://stripe.com/
  https://www.braintreepayments.com
  https://www.pcisecuritystandards.org/pdfs/pciscc_ten_common_myths.pdf
  https://medium.com/@folsen/accepting-payments-is-getting-harder-1b2f342e4ea#.897akko4q
POST SERIES B

- **Enforce Two-factor authentication (2FA)**
  
  Enforce 2FA on all the services used (whenever possible).
  
  [https://duo.com/](https://duo.com/)
  [https://auth0.com/](https://auth0.com/)

POST SERIES B

- **Ensure Compliance with Relevant Industry Standards**
  
  Comply to standards to ensure you follow industry best practices and answer your customer needs. But simple compliance will never protect your apps.
  
  [https://cloudsecurityalliance.org/](https://cloudsecurityalliance.org/)

SERIES B

- **Have a public bug bounty program**
  
  A bug bounty program will allow external hackers to report vulnerabilities. Most of the bug bounties program set rewards in place. You need security aware people inside your development teams to evaluate any reports you receive.
  
  [https://www.hackerone.com/](https://www.hackerone.com/)

SERIES A

- **Have a public security policy**
  
  This is a page on your corporate website describing how you plan to respond to external security reports. You should advise you support [responsible disclosure](https://). Keep in mind that most of the reports that you receive probably won’t be relevant.
SERIES B

❑ Protect against Denial Of Service (DoS)

DoS attacks are meant to break your application and make it unavailable to your customers. Use a specific service to protect your app against Distributed Denial Of Service attacks.

https://www.akamai.com/
https://www.cloudflare.com/ddos/

SERIES A

❑ Protect your applications against breaches

Detect and block attacks in real-time using a protection solution. All the OWASP top-10 vulnerabilities (SQL injections, NoSQL injections, cross-site scripting attacks, code/command injections, etc.) are covered.

https://www.sqreen.io/
https://en.wikipedia.org/wiki/Web_application_firewall

SERIES A

❑ Protect your servers and infrastructure

Your servers will be scanned in order to fingerprint your application and locate open services, misconfiguration, etc. You can setup tools to keep these scanners away from your servers.

https://www.digitalocean.com/community/tutorials/how-to-protect-ssh-with-fail2ban-on-ubuntu-14-04
SERIES A

- **Protect your users against account takeovers**

  Account takeovers or brute force attacks are easy to setup. You should make sure your users are protected against account takeovers.

  [https://www.sqreen.io/](https://www.sqreen.io/)
  [https://www.owasp.org/index.php/Blocking_Brute_Force_Attacks](https://www.owasp.org/index.php/Blocking_Brute_Force_Attacks)
  [https://security.stackexchange.com/questions/94432/should-i-implement-incorrect-password-delay-in-a-website-or-a-webservice](https://security.stackexchange.com/questions/94432/should-i-implement-incorrect-password-delay-in-a-website-or-a-webservice)

---

**Monitoring**

---

SERIES A

- **Audit your infrastructure on a regular basis**

  With cloud providers, it’s easy to start instances and forget about them. You will need to create and maintain a list of your assets (servers, network devices, services exposed etc…), and review it regularly to determine if you still need them, keep them up to date, and ensure that they benefit from your latest deployments.

  [https://github.com/Netflix/security_monkey](https://github.com/Netflix/security_monkey)

---

SERIES A

- **Check that TLS certificates are not set to expire**

  You should be using TLS certificates. It can be a hassle to configure and monitor but don’t forget to renew them!

  [https://www.ssllabs.com/](https://www.ssllabs.com/)
SERIES A

Detect insider threats

The most important attacks will come from insider threats. Those can be users or attackers gaining access to privileged user accounts. Make sure you monitor your users to detect attackers before an attack happens.

https://www.sqreen.io/

SERIES B

Get notified when your app is under attack

You will be attacked. Make sure you have a monitoring system in place that will detect security events targeting your application before it’s too late. Knowing when your application is starting to get massively scanned is key to stop more advanced attacks.

https://www.linode.com/docs/security/using-fail2ban-for-security#email-alerts
https://www.sqreen.io/
http://alerta.io/

SERIES A

Monitor third party vendors

You’re likely to use third party products to manage your servers / payrolls / logs or even just social media. Just like you’re likely to be hacked, they can be too. Make sure you follow the news and react immediately after a breach.

https://haveibeenpwned.com/
https://twitter.com/SecurityNewsbot

SERIES B

Monitor your authorizations

Be proactive and be alerted when authorizations or keys binary are changed in your production.

http://techblog.netflix.com/2017/03/netflix-security-monkey-on-google-cloud.html
https://cloudsploit.com/events
Monitor your DNS expiration date

Just like TLS certificates, DNS can expire. Make sure you monitor your DNS expiration automatically.

https://github.com/glensc/monitoring-plugin-check_domain
