Early on, COVID-19 has exposed vulnerabilities in current food and health systems around the world. Evidence also unequivocally showed that obesity is an independent and leading risk for complications and mortality for COVID-19.

With many countries today facing a triple burden of malnutrition which will likely worsen due to COVID-19 and increase risks of food insecurity, actions to strengthen food systems and address the commercial determinants of health are urgently needed to improve the food environments and protect our global community.

As we have now passed the halfway point for the Decade of Action on Nutrition, there is a chance to build on the current momentum to reframe issues and initiate global action. In September 2021, the UN Food Systems Summit will be convened to drive progress towards the 2030 Sustainable Development agenda. World Obesity’s policy laboratory webinar will explore food systems’ central role in addressing the obesity pandemic. Through several case studies, our speakers will highlight best practices and reflect on existing gaps and barriers to address if we are to establish healthier, more sustainable, and equitable food systems for everyone.

The event precedes the launch of World Obesity’s policy dossier on food systems and a briefing on the topic in September.

As we reach the halfway point of the UN Decade of Action on Nutrition, there is an urgent responsibility to ensure global food systems can deliver healthy and sustainable diets for everyone.
